Effect of different intensities of grazing by goat on vegetation cover, runoff and soil loss *vis-a-vis* animal production. Abstracts Vol. II, Third Internl. Rangeland Congress, New Delhi, Nov. 07-11, 1988:419-422.

The effects of different intensities of grazing by goats on vegetation cover, runoff and soil loss in a forest watershed in Yamuna ravines have been discussed. The study showed that direct continuous grazing of 4 goats/ha in a ravine watershed protected by 20 years old

forests and gully plugs has no adverse effects on protective characters of vegetation as well as on runoff and soil loss characteristics of watershed. On the other hand, it produced about 1.65 kg/goat/month of live body weight, corresponding to about Rs. 1600/ha/annum.
