Control of gully erosion in ravine lands of Gujarat. *J. Soil & Water Conserv. India*, 8(1):65-77.

The paper describes various measures adopted to control erosion rates at Vasad (Gujarat). These include construction of contour and peripheral bunds and diversion channels of the table lands and heads and sides of gullies and by gully plugs in gully beds. Suitable specifications for contour bunds and gully plugs have been evolved for adoption in this area. Due to this, it was possible to successfully raise horticultural and forest trees on gully beds and grasses on marginal lands, gully slope and gully plugs.
