

erosion classes depicting (< 10 t/ha/yr).

Rajhansath, B. and Erasmus, I.I. 1971. A method for estimating erosion potential

from daily rainfall data. *Indian For.*, 97(3):122-125.

Authors have tried to correlate daily rainfall amounts with erosion indices in order to widen the scope of applicability of the rainfall data in conservation planning of watersheds. With adjustments for regional variations in soil cover and landuse it would be possible to rationalise and plan conservation practices for areas showing similar erosion patterns.
