

177. **Bonde, W.C. and Kale, M.V. 1983.** Fertility building of exposed subsoil due to soil conservation treatment in reclaimed ravine lands of Gujarat. *Indian J. Soil*

*Conserv.*, 11(1):72-75.

During reclamation of ravines, infertile sub-soil is brought to surface. To get economic returns, fertility building of such reclaimed lands is necessary. Results of the experiment show that application of heavy doses of F.Y.M. in addition to green manuring continuously for four years not only improve the fertility status of the soil but increase the yields of wheat and bidi tobacco crops.
