

281. **Das, D.C., Raghunath, B. and Poornachandran, G. 1971.** Comparison of the estimated spacings of bunds and terraces by modified Stewart's formula (Ootacamund) with a few existing formula for few places. *The Harvester*, XIII:33-39.

The authors discuss modified Stewart's formula which, they say, gives comarable results of that obtained by the prevailing formulae of the USDA form. It exhibits a better theoretical basis and takes into consideration the rainfall intensity, erosion ratio and landuse practice specifically. The estimation of spacing of bunds and terraces by this formula for the same place will not vary from person to person and involves easily determinable factors. It is more flexible in readjusting the spacing to the varying land management.
