

Pratap Narain and Singh, Ravender. 1987. Effect of mechanical measures on soil profile and land productivity. *Indian J. Soil Conserv.*, 15(3): 68-79.

The paper reviews the role of mechanical measures in conjunction with biological measures as the most effective tools of soil and water conservation. Over a period of time, these measures improve physico-chemical properties of soil gradually, recharge soil profile moisture and ground water and improve crop yields.
