PLANT PROTECTION EVALUATION	19
CONCLUSIONS	50

Executive Summary

The All India Coordinated Cotton Improvement Project (AICCIP) undertook the evaluation of 40 cotton hybrids, viz., ACH-33-1, ACH-155-1, BRAHMA, GK.204, GK.205, GK.206, JKCH.226, JKCH.666, KDCHH.9632, KIRTIMAN, KRISHNA, MRC.6352, NCS.138, NCS.145, NCS.207, NECH.2R, NECH.3R, NPH.2171, NPH.2250, NPH.2270, PRCH.101, PRCH.102, PRCH.103, RCH.377, Tulasi.117, Tulasi.4, VARUN, VCH.110, VCH.111, VCH.112, possessing BG I gene, ACH-11-2x, KDCHH.441X, KDCHH.531X, MRC.7226X, MRC.7347X, RCH.512X, RCH.533X with Bollgard II genes, Bunny VIP, 2-58 VIP, & 2-81 VIP in five central Zone centres, viz., Central Institute for Cotton Research Institute, Nagpur, Dr.Punjabrao Deshmukh Krishi Vidyapeeth, Akola, Cotton Research Station of Marathwada Agricultural University, Nanded, Cotton research Station, Khandwa of Jawaharlal Nehru Krishi Vishwa Vidyalaya, and Cotton Research Station, Surat of Navsari Agricultural University for the second year in succession (vide ICAR letter No.2(8)/2003-C.C.I. dated 25.4.2003). The trials were laid out in accordance with standard package of practices of cotton cultivation, followed at respective centers, where the evaluations were undertaken. The untreated, acid de-linted seeds of the relevant test hybrids were provided by the above seed companies. MECH.162Bt & RCH.2Bt were the Bt check hybrids while NHH.44 was the non-Bt check hybrid for this zone.

Under unprotected conditions, the Spotted bollworm and American bollworm were in low levels in various centres of central zone. The number American bollworm per plant was recorded at three centres under protected conditions. There was no infestation of this pest so as to be seen above the mean count of 1 per plant. While NHH.44 recorded over 5% damage due to American bollworm on the squares, the all Bt test recorded only 0.1 to 3.08% square damage, as seen below. The maximum number of Pink bollworm in test hybrids, under unprotected condition, was in ACH-155-1 (19.8), NCS.145 (18.5), NCS.207 (19.6), followed by Bunny -VIP (13.6) in comparison to that in NHH.44 (16.9). The expression of the candidate gene to deter Pink bollworm survivorship in green boll is doubtful in these entries. The entries possessing BG II genes were found to counter Pink bollworm damage more effectively over VIP gene. The Pink bollworms in green bolls in BG II entries were at par with that of BG I entries. The VIP gene-possessing hybrids recorded 13 to 14% as against 18.42% in NHH.44 hybrid. The percent open boll damage was quite high in the VIP gene bearing hybrids (25-29%) in comparison to the check hybrid, NHH.44 (39.8%). The open boll damage above 10% indicates poor bollworm suppression in these hybrids.

Grey mildew disease was noticed only at Nanded in both protected and unprotected plots. Under unprotected conditions, the following Bt hybrids have been found to be susceptible to Grey mildew having more than 20 percent disease incidence in the grades of three and four; NECH 32, Bunny VIP, 2 - 81 VIP, ACH – 33 – 1, MRC 6325, MRC 7226X, MRC 7347X, NCS 138, NCS 145, BRAHMA, KDCHH 9632, KDCHH 531X, KDCHH 441X, GK 206, and also the zonal check NHH 44 and common check MECH 162 Bt. The above hybrids were also found to be susceptible to a less extent under protected conditions.

Central Zone is known to have Parawilt syndrome in cotton. Special effort to record observations on this was taken up in these test hybrids. The Parawilt was noticed at a higher percentage at Khandwa than at Akola. A maximum incidence of 32.22 percent was seen in the Bt hybrid NPH 2270. The seed cotton yield was not affected due to the late occurrence of the Para wilt.

Even though Alternaria leaf spot disease was noticed both at Nagpur and Nanded, there was significant incidence only at Nanded. Under **protected conditions** a disease incidence of more than 10.00 percent was noticed in NECH 3R, 2 – 81 VIP, JKCH 666, ACH – 11 – 2X, ACH – 33 – 1, RCH- 533X, MRC -6325, MRC – 7226X, MRC 7347X, NCH 138, Brahma, Krishna, KDCHH 441X, NPH 2250, GK 204, GK 205, GK 206, VCH 112, MECH 162 Bt (cc), and NHH 44(2c). The rest of the hybrids had less than 10.00 percent incidence.

The number of spraying against sap sucking pests (SP) and bollworms (BW), undertaken in different Bt and non Bt genotypes under PROTECTED conditions show that NHH.44 had 4.67 sprayings in this zone. Many test hybrids had similar number of sprayings as in the case of check Bt hybrids. Under unprotected conditions, the number of sprayings was 3.0 to 3.33 in Bt hybrids against 4 in NHH.44. Under protected conditions, this was above 4 for Bt hybrids, indicating that they also received one or more sprays against bollworms.

Under Protected condition, those hybrids that yielded over 1900 kg/ha were RCH.377 (2115 kg/ha), JKCH.226 (2078 kg/ha), PRCH.101 (2036 kg/ha) & GK.205 (1987 kg/ha), RCH.512X (1971 kg/ha) and MRC.7226 (1940 kg/ha). However, under unprotected condition, GK.205 (1648 kg/ha), PRCH.103 (1554 kg/ha), RCH.377 (1546 kg/ha), NCS.207 (1535 kg/ha), MRC.7226X (1514 kg/ha), ACH-155-1(1517 kg/ha) and VCH.110 (1506 kg/ha) were the top yielding genotypes.

The fibre property values indicated that most of the entries did not satisfy CIRCOT and SITRA (South India Textile Research Association – Textile Ministry) norms. The fibre strength values did not match with the span length data in all the test hybrids.

Introduction

The All India Coordinated Cotton Improvement Project (AICCIP) undertook the evaluation of 40 cotton hybrids, viz., ACH-33-1, ACH-155-1, BRAHMA, GK.204, GK.205, GK.206, JKCH.226, JKCH.666, KDCHH.9632, KIRTIMAN, KRISHNA, MRC.6352, NCS.138, NCS.145, NCS.207, NECH.2R, NECH.3R, NPH.2171, NPH.2250, NPH.2270, PRCH.101, PRCH.102, PRCH.103, RCH.377, Tulasi.117, Tulasi.4, VARUN, VCH.110, VCH.111, VCH.112, possessing BG I gene, ACH-11-2x, KDCHH.441X, KDCHH.531X, MRC.7226X, MRC.7347X, RCH.512X, RCH.533X with Bollgard II genes, Bunny VIP, 2-58 VIP, & 2-81 VIP in five central Zone centres, viz., Central Institute for Cotton Research Institute, Nagpur, Dr.Punjabrao Deshmukh Krishi Vidyapeeth, Akola, Cotton Research Station of Marathwada Agricultural University, Nanded, Cotton research Station, Khandwa of Jawaharlal Nehru Krishi Vishwa Vidyalaya, and Cotton Research Station, Surat of Navsari Agricultural University for the second year in succession (vide ICAR letter No.2(8)/2003-C.C.I. dated 25.4.2003). The trials were laid out in accordance with standard package of practices of cotton cultivation, followed at respective centers, where the evaluations were undertaken. The untreated, acid de-linted seeds of the relevant test hybrids were provided by the above seed companies. MECH.162Bt & RCH.2Bt were the Bt check hybrids while NHH.44 was the non-Bt check hybrid for this zone.

Date of sowing and final harvest

Dates	Nagpur	Akola	Nanded	Surat	Khandwa
Date of sowing	17.06.04	9.7.04	05.07.04	15.6.2004	26.06.04
Date of final harvesting	31.01.05	29.01.05	02.02.05	11.01.05	25.01.05

BREEDING EVALUATION

DESIGN: Randomised Block Design 2 Replications – 3 ROWS X 6 metre rows with plant protection, based on recommended package of practices of the respective centres with plant protection against all pests and diseases at the prescribed economic threshold levels for each of those biotic stresses in the concerned entries from time to time, based on close monitoring for their incidence and damage. These observations on pests and diseases were also recorded from time to time.

PLANT PROTECTION EVALUATION

DESIGN: Randomised Block design 2 Replications – 3 ROWS X 6 metre rows with no plant protection measures against prevalent bollworms and diseases. However, protection against sap sucking pests in respective entries, based on the recommended practices of respective centres was made. These observations on pests and diseases were also recorded from time to time.

RESULTS OF EVALUATIONS

The Breeding and Plant Protection evaluations were undertaken and the data recorded in the designated five centers. The results are given below in this report.

BREEDING EVALUATION

The breeding evaluation concentrated on various observations on plant biometric characters such as number of monopodia per plant, number of sympodia per plant, nodes per plant, mean length of sympodia, number of fruiting points per sympodium, number of green bolls per plant at harvest, number of burst bolls per plant at harvest, mean boll weight, seed index, Lint index, mean seed cotton yield per plant and per plot and final yield (calculated) of seed cotton yield per hectare in addition to the fibre length, strength and micronaire of the entries tested.

The Germination data of the Breeding evaluation are given below. The general plant stand of all entries was quite good, as seen from the following tables.

Germination Data (%)

General observations on test hybrids

General observations on the plant types, mixtures of genotypes, variations in morphological characters such pollen and anther colours, sterile plants, tendency for square drying etc. were recorded in various centres. It has to be pointed out that the variations in plant type were seen in the test hybrids of many companies unlike that seen in previous years. The centres reported anther colour variation (yellow & buff) in NECH.2R, non-uniform plants in JKCH.666, ACH-155-1 & Kirtiman. Sterile plants were observed in 2-58 VIP, MRC.6352, and KDCHH.441X. Many entries showed square drying, as given below.

Entry	General observations
NECH.2R	Anther colour variation was observed (Yellow and buff)
NECH.3R	-
Bunny VIP	Square drying was observed
2-58 VIP	Square drying was observed
2-81 VIP	Sterile plants (in RI – 1 in 36 plants) and Square drying was observed
VARUN	Square drying was observed
JKCH.226	Square drying was observed
JKCH.666	Plant variation was observed
ACH-11-2x	Wilting and hairy and Non hairy plants observed
ACH-33-1	-
ACH-155-1	Plant variation was observed (Hairy and Non hairy)
RCH.512X	Square drying was observed
RCH.533X	-
RCH.377	-
MRC.6352	Sterile plants and Square drying was observed
MRC.7226X	-
MRC.7347X	-
NCS.138	-
NCS.145	-
NCS.207	-
BRAHMA	-
KRISHNA	-
KIRTIMAN	Plant variation was observed (Hairy and Non hairy)
KDCHH.9632	Square drying was observed
KDCHH.531X	-
KDCHH.441X	Sterile plants (2 in 36, and 1 in 35 plants) and Square drying was observed
PRCH.101	-
PRCH.102	Square drying was observed
PRCH.103	-
NPH.2171	Square drying was observed
NPH.2250	-
NPH.2270	Square drying was observed
GK.204	Square drying was observed
GK.205	Square drying was observed
GK.206	-
VCH.110	-
VCH.111	-

VCH.112		-			
Tulasi.4		-			
Tulasi.117		-			
RCH.2Bt(CC)	Square drying was observed				
MECH.162Bt(CC)		-			
NHH.44(ZC)	Square drying was observed				

Number of Sympodia

It was noticed that the number of sympodia varied from 12.6 to 17.1 in different genotypes. The best was in ACH-155-1.

Entry	Nagpur	Nanded	Surat	Khandwa	Mean
NECH.2R	18.3	13.8	18.0	11.0	13.6

TOTAL BOLLS / PLANT:

The table below provides the number bolls per plant. The entries such as VCH.112 and Tulasi-117 recorded mean number over 30/plant in this zone. NHH.44 recorded 23.4 bolls/plant, similar to that in Bt check hybrids.

Entry	Nagpur	Akola	Nanded	Surat	Khandwa	Mean

SEED COTTON YIELD

Many hybrids yielded over 1600 kg/ha. GK.106 (1737.4 kg/ha), GK.107 (1708.8 kg/ha), JKCH.226 (1681.8 kg/ha), 2-58VIP (1666.8 kg/ha), RCH.377 (1670 kg/ha) were the top most entries. Many test hybrids (Varun, MRC. 6352, JKCH.666, Kirtiman, NPH.2171, NPH.2220, and Tulasi.4 & Tulasi.117) yielded lower than the check hybrids.

Fibre property data

2.5% Span length(mm)

Many of the entries recorded average fibre length of 30 mm and above in this zone. The following table provides a glimpse of the variation in fibre length amongst test entries.

Genotypes	Nagpur	Akola	Nanded	Surat	Khandwa	mean
NECH.2R	29.1	30.5	27.8	31.7	32.5	30.32

Tenacity (g/tex)

The tenacity of the fibre ranged from 19 to 22 g/tex in various entries in this zone. It is important to note that the improvement of fibre quality was evident in these test hybrids.

CONSOLIDATED FIBRE PROPERTY FOR CENTRAL ZONE

The zone's average fibre property data of various parameters are given below. The fibre property values indicated that most of the entries did not satisfy CIRCOT and SITRA (South India Textile Research Association – Textile Ministry) norms. The fibre strength values did not match with the span length data in all the test hybrids.

PLANT PROTECTION EVALUATION

The FIVE AICCIP CENTRES in central zone were directed to evaluate the performance of the eight Bt hybrid entries for reaction to all the prevailing pests and diseases along with their non-Bt counterparts as well as with their Bt check and local check variety. Data were recorded on the incidence and damage due to various pests and diseases prevalent during the season in these five AICCIP centers.

Under protected and un-protected conditions, the performance of test hybrids against prominent pests such as leaf hoppers (jassids), whitefly amongst sap sucking insects and all the bollworm species in addition to other minor pests such as leaf feeding caterpillars was evaluated. Amongst diseases, the presence of Bacterial blight, Grey mildew and Parawilt were given paramount attention in this zone.

Entomology Evaluation

The Entomology evaluation was targeted primarily to test the action of Cry IA (c) gene in forty Bt trial hybrids against the following bollworms.

SPOTTED BOLLWORM- *Earias vittella* Fabricius

SPINY BOLLWORM – *Earias insulana* Boisduval

AMERICAN BOLLWORM – *Heicoverpa armigera* Hubner

PINK BOLLWORM – *Pectinophora gossypiella* (Saunders)

This was undertaken in sprayed plots of Breeding evaluation and unsprayed plots of Plant Protection evaluation in all the five locations of central zone. The insecticides sprayings were decided based on the threshold levels of sap sucking pest species and bollworms that invaded the various test hybrids. The sprayings were undertaken in both the plots of the two replications, once it is made sure that one of the plots in a replication has crossed the threshold level of bollworm infestation in respect of the candidate hybrid. The incidence of American bollworm was low to moderate in the AICCIP centres of this zone during the entire 2004 kharif season.

PLANT PROTECTION EVALUATION – protected conditions (Details of plant protection against insect pests in breeding trials)

Sap sucking pests

The maximum aphid population, observed in the early phase of the crop was quite high in some hybrids, as seen from the following table, requiring plant protection measures.

Aphid (average of 3 leaves/plant)

Spotted bollworms

The Spotted bollworms did not appear in all the centres. In Nanded and Surat, this pest was noticed in the experimental plots, as seen in the following table. NHH.44, the check hybrid harboured the maximum population in the zone. The Bt hybrids had the juveniles of this pest below the threshold level.

American Bollworms

This pest was recorded at very low level in this zone during 2004-05 season. The Bt test hybrids did not have this caterpillar above threshold limits. However, the Bt check hybrid, MECH.162Bt and NHH.44 were seen to have more than the threshold level. The data provided herein shows the maximum incidence during this crop season, after looking into the weekly data of observations.

American bollworms square damage

The percent damage due to American bollworm was assessed in this zone on the test hybrids and are presented in the following table. Negligible damage was seen in all the Bt hybrids. The check hybrids also did not show any appreciable damage, showing thereby that the pest pressure was low during this season.

Pink Boll Worm in green bolls

The maximum number of Pink bollworms in green bolls was 11.82 in NHH.44 hybrid. The Bt hybrids had very low number of population of this bollworm in comparison to NHH.44. Maximum number of Pink bollworm was recorded in Nanded. The next highest was in Tulasi.177, as shown in the following table.

Locule damage (%)

The percent locule damage was found to be high in NHH.44 hybrid in comparison to all the Bt hybrids of this evaluation. Nanded centre recorded the most damage, as can be seen from the following table.

Entry	Locule damage (%)				Mean %

The following table provides the number of sprayings against sap sucking pests (SP) and bollworms (BW). The number of sprayings, undertaken in different Bt and non Bt genotypes under PROTECTED conditions show that NHH.44 had 4.67 sprayings in this zone. Many test hybrids had similar number of sprayings as in the case of check Bt hybrids.

Number of pesticide sprayings under protected conditions

Spotted bollworms

Under unprotected conditions, the pest was in low levels in various centres of central zone. Nanded and Surat recorded more of this insect than Akola. NHH.44 recorded over 2 larvae per plant, while the test Bt hybrids recorded very low numbers of this pest per plant, as seen in the table below.

American bollworms

The number of American bollworms per plant was recorded at three centres under protected conditions. There was no infestation of this pest so as to be seen above the mean count of 1 per plant.

Square damage due to American bollworms (%)

While NHH.44 recorded over 5% damage due to American bollworm on the squares, the all Bt test recorded only 0.1 to 3.08% square damage, as seen below.

Pink Boll worm in green bolls

The maximum number of Pink bollworm in test hybrids, under unprotected condition, was in ACH-155-1 (19.80), NCS.145, NCS.255 followed by Bunny -VIP (13.55), as given in the following table. The expression of the candidate gene to deter Pink bollworm survivorship in green boll is doubtful in these entries. The entries possessing BG II genes were found to counter Pink bollworm damage more effectively over VIP gene. The Pink bollworms in green bolls in BG II entries were at par with that of certain BG I entries (NECH.2R, NECH.3R, Varun, JKCH.226, JKCH.666, RCH.377, MRC.6352, NCS.138, Krishna, Kirtiman, PRCH hybrids, NPH hybrids, VCH hybrids and Tulasi hybrids.

Average Number of Pink Boll worm in 20 green bolls

Open boll damage:

The percent open boll damage was quite high in the VIP gene bearing hybrids in comparison to other Bt hybrids. The maximum damage was in NHH.44. The open boll damage above 10% indicates poor Pink bollworm (PBW) suppression in those hybrids. The Hybrids with BG I and BG II genes did not vary in their damage level due to PBW.

Under unprotected conditions, the number of sprayings was 3.0 to 3.33 in Bt hybrids against 4 in NHH.44. Under protected conditions, this was above 4 for Bt hybrids, indicating that they also received one or more spray against bollworms.

Number of sprayings for sucking pest under UNPROTECTED conditions

Seed cotton yield

The seed cotton yield, under unprotected conditions, was the highest in RCH.377 (1991 kg/ha), followed by RCH.533X (1941 kg/ha). The seed cotton yield in other comparable hybrids was PRCH.101(1935 kg/ha), PRCH.103(1929 kg/ha), GK.205 (1898 kg/ha), VCH.111 (1809 kg/ha). Check Bt hybrids, viz., MECH.162Bt and RCH.2Bt yielded 1651 and 1694 respectively, while NHH.44 yielded 1371 kg/ha.

The following table provides an idea about the performance of these test Bt hybrids under protected and unprotected conditions. It is found that most of them gave more seed cotton yield under unprotected conditions. Under low bollworm pressure, the assessment of performance based on seed cotton yield is difficult with the available data of this year. The only Bt hybrid that provided good seed cotton yield under both the conditions is RCH.377 and GK.205.

PLANT PATHOLOGY EVALUATION

During this year Bacterial blight disease was prevalent in the five centres where the 40 Bt cotton hybrids were evaluated for their reaction to diseases. Alternaria leaf spot was noticed only at Nagpur and Nanded whereas serious incidence of Grey mildew was observed in Nanded. Parawilt was present in Khandwa and Akola. Low incidence of Myrothecium leaf spot was also noticed in Nagpur.

Bacterial Blight

Very high incidence of bacterial blight was noticed at Akola and Surat. At Nagpur, Nanded and Khandwa this disease was seen in less severe form. Almost all Bt hybrids were found susceptible to this disease at Akola with JKCH 226 having maximum disease incidence (35.81%) and VCH 112 and Tulasi-4 with least disease incidence (11.37%). At Surat, JKCH 226 (32.75%) had the maximum disease, as given in the following table.

Alternaria Leaf Spot

Even though this disease was noticed both at Nagpur and Nanded, there was significant incidence only at Nanded. Under **protected conditions** a disease incidence of more than 10.00 percent was noticed in NECH 3R, 2 – 81 VIP, JKCH 666, ACH – 11 – 2X, ACH – 33 – 1, RCH- 533X, MRC -6325, MRC – 7226X, MRC 7347X, NCH 138, Brahma, Krishna, KDCHH 441X, NPH 2250, GK 204, GK 205, GK 206, VCH 112, MECH 162 Bt (cc), and NHH 44(2c). The rest of the hybrids had lesser than 10.00 percent incidence, as given below.

Grey mildew

Grey mildew was noticed only at Nanded in both protected and unprotected plots. Under unprotected conditions, the following Bt hybrids have been found to be susceptible to Grey mildew having more than 20 percent disease incidence in the grades of three and four; NECH 32, Bunny VIP, 2 - 81 VIP, ACH – 33 – 1, MRC 6325, MRC 7226X, MRC 7347X, NCS 138, NCS 145, BRAHMA, KDCHH 9632, KDCHH 531X, KDCHH 441X, GK 206, and also the zonal check NHH 44 and common check MECH 162 Bt. The above hybrids were also found to be susceptible to a less extent under protected conditions, as given in the following table

Parawilt

The Parawilt was noticed at a higher percentage at Khandwa than at Akola. A maximum incidence of 32.22 percent was seen in the Bt hybrid NPH 2270. The hybrids Bunny VIP, MRC 6325, and NCS 207 did not suffer from wilting both at Khandwa and Akola. The seed cotton yield was not affected due to the late occurrence of the Para wilt.

Myrothecium Leaf Spot

A maximum incidence of 7.73 percent was noticed on the hybrids VCH 111 and 7.03 on Kirtiman at Nagpur and the rest of them very low incidence, as given below. This disease at times becomes serious under central zone conditions of alternating dry and wet spells.

Reaction of Bt hybrids to Myrothecium Leaf Spot (Percent Disease Incidence)

Entry	Nagpur
NECH.2R	1.54
NECH.3R	3.40

CONCLUSIONS:

- Since the bollworm Spotted bollworm and American bollworm pressure was quite low, actual gene action to resist these pests could not be tested. However, the data on Pink bollworm number in green bolls and their damage to bolls do speak about the poor efficacy of various Bt genotypes to counteract this bollworm that is building up in central India in cotton.
- Under Protected condition, those hybrids that yielded over 1900 kg/ha were RCH.377 (2115 kg/ha), JKCH.226 (2078 kg/ha), PRCH.101 (2036 kg/ha) & GK.205 (1987 kg/ha), RCH.512X (1971 kg/ha) and MRC.7226 (1940 kg/ha). However, under unprotected condition, GK.205 (1648 kg/ha), PRCH.103 (1554 kg/ha), RCH.377 (1546 kg/ha), NCS.207 (1535 kg/ha), MRC.7226X (1514 kg/ha), ACH-155-1(1517 kg/ha) and VCH.110 (1506 kg/ha) were the top yielding genotypes. The genotypes that yielded better in both the protected and unprotected conditions during 2004 season were JKCH.226 (2078, 1478 kg/ha), RCH.377 (2115, 1546 kg/ha), MRC.7226X (1940, 1514 kg/ha), PRCH.101 (2036, 1483 kg/ha) and GK.205 (1987, 1648 kg/ha).
- The fibre property values indicated that most of the entries did not satisfy CIRCOT and SITRA (South India Textile Research Association – Textile Ministry) norms. The fibre strength values did not match with the span length data in all the test hybrids.
