## Executive Summary

- The All India Coordinated Cotton Improvement Project (AICCIP) undertook the evaluation of **THRTY SEVEN Bt cotton hybrids, viz., NECH.2R, NECH.3R, NECH.4R (detected to be H x B hybrid)**, Bunny VIP, 2-62 VIP, 2-42 VIP, JKCH.99, DURGA, ESWAR, ACH.11-1, ACH-21-1, ACH-33-1, RCH.524 X, RCH.111, RCH.371, MRC.6100, MRC.7228X, MRC.7351X, NCS.145, NCS.207, NCS.913, DHANWAN, BRAHMA, KDCHH.9632, KDCHH.531X, KDCHH.441X, PRCH.101, PRCH.102, PRCH.103, NPH.2270, NPH.2171, NPH.2250, GK.207, GK.208, GK.209, TULASI.4 & TULASI.117. The Bt check hybrids were RCH.2 Bt, MECH.162 Bt & lokak check hybrid was BUNNY.
- The Bt hybrid, NECH.4R from Nath Seeds Pvt. Ltd., Aurangabad was seen to be H x B hybrid. Since this is an intra-hirsutum evaluation and this company has provided hirsutum x barbadense hybrid seed for this evaluation, the results of this hybrid is not included in this report and this hybrid entry shall not be included in the next year's evaluations also.
- The germination of the genotypes was reasonably good in all locations and the plant stand was quite good. It was found out that NECH.4R of M/S Nath seeds Pvt. Ltd., Aurangabad turned out to be hirsutum x barbadense hybrid which was to have been separately entered in that category of trials.
- During this year, there was drought in Nandyal and Siruguppa centres and the crop growth was affected at various phenological stages.
- The American bollworm incidence was quite negligible in this zone during 2004 season and hence proper assessment of the reaction of these 37 hybrids could not be undertaken. This was the case in unsprayed conditions too in this zone. The percent locule damage was seen to be low in most of the hybrids. In some cases, it has been recorded at a range of 11.0 to 13.3. The check hybrid, Bunny recorded 15.5% locule damage. Some of the entries such as Bunny VIP, ACH-33-1, NPH.2250 (14.3%) recorded 13.3% locule damage.
- The Pink bollworm damage was indicated by the open boll damage measurements in these hybrids in this zone. The mean values are presented below. It is found that hybrids such as NRECH.2R and PRCH. 101 (11.1%) had high damage in comparison to Bt and non-Bt check hybrid. Other test hybrids also recorded higher than the Bunny check hybrid.
- Most of the hybrids needed 3.5 to 4.0 sprayings of insecticides to counter the sap sucking pests in breeding evaluation. These hybrids were seen to be susceptible to various sap sucking pests and demanded protection at various phenological stages.

- Under unprotected conditions, the locule damage was quite high. The gene action was amiss in these test hybrids and Pink bollworm damage was high; it may be noted that the other two bollworms were very low in population.
- There was very severe incidence of Alternaria leaf spot disease at the Dharwad and Siruguppa centres and all the forty hybrids were found susceptible to this disease (Grade 4). Very high incidence of Grey mildew was noticed in the Dharwad and Siruguppa centres and all the 40 hybrids were found susceptible (Grade 3 - 4) to this disease. Helminthosporium leaf spot and Cercospora leaf spot diseases were observed only in the Lam centre. All forty hybrids were found to be susceptible to these two diseases.
- The seed cotton yield data shows that, under protection against sap sucking pests, the mean seed cotton yield of the zone was at the maximum in **MRC.7351X (2692 kg/ha)**, **MRC.7228X (2637 kg/ha)**, **MRC.6100 (2186 kg/ha)**, **GK 208 (2159 kg/ha)**, **RCH.371 (2120 kg/ha)** and **BRAHMA (2105 kg/ha)**.
- The seed cotton yield under unprotected conditions was seen to be drastically less than that under protected conditions. The highest seed cotton yield was recorded in **MRC.7228X (2398 kg/ha)** and **MRC.7351X (2392 kg/ha)**. **MRC.6100 recorded (2048 kg/ha)** seed cotton. The seed cotton yield under unprotected conditions was seen to be drastically less than that under protected conditions. It is seen that these Bt hybrids needed insecticide support to provide appreciable seed cotton yield in this zone.
- The fibre strength and tenacity values in all the hybrids want in fibre strength commensurate with the span length. As is stipulated in All India Coordinated Cotton Improvement Project final stages of evaluations of genotypes, the full scale mill test could only bring out the merit of fibre, as stipulated by SITRA (South India Textile Research Association, Textile Ministry) norms.

### **Conclusions:**

- ❖ The data on various parameters of evaluations of 36 test hybrids show that these hybrids are susceptible to sap sucking pests and the gene action to reduce Pink bollworm was also not evident due to high percentage of open boll damage.
- ❖ The fibre quality data of these hybrids do not provide enough evidence that they conform to SITRA norms that is now accepted as the yard-stick of fibre quality for achieving defined yarn quality and yield. Confirmation of this through full scale mill test is desirable to recommend the promising hybrids for cultivation by farmers in this zone. The worthiness of the genotype has to be based on their ability to reduce damage due to the three bollworms along with desirable fibre property.

## EVALUATION REPORT FOR FIRST YEAR

### Introduction

The All India Coordinated Cotton Improvement Project (AICCIP) undertook the evaluation of **THRTY SEVEN Bt cotton hybrids, viz., NECH.2R, NECH.3R, NECH.4R (detected to be H x B hybrid)**, Bunny VIP, 2-62 VIP, 2-42 VIP, JKCH.99, DURGA, ESWAR, ACH.11-1, ACH-21-1, ACH-33-1, RCH.524 X, RCH.111, RCH.371, MRC.6100, MRC.7228X, MRC.7351X, NCS.145, NCS.207, NCS.913, DHANWAN, BRAHMA, KDCHH.9632, KDCHH.531X, KDCHH.441X, PRCH.101, PRCH.102, PRCH.103, NPH.2270, NPH.2171, NPH.2250, GK.207, GK.208, GK.209, TULASI.4 & TULASI.117.

**Out of these, NECH.4R was seen to be H x B hybrid from Nath Seeds Pvt. Ltd., Aurangabad. Since this is an intra-hirsutum evaluation and this company has provided hirsutum x barbedense hybrid, the results of this hybrid shall be withheld and next year, this hybrid entry will not be conducted.**

The Bt check hybrids were RCH.2 Bt, MECH.162 Bt & local check hybrid was BUNNY. The Breeding and Plant Protection evaluations were conducted in five South Zone centres, viz., Tamil Nadu Agricultural University, Coimbatore and its RARS at Vaigai Dam, University of Agricultural Sciences, Dharwad and its RARS, Siruguppa, Acharya NG Ranga Agricultural University, RARS, Guntur and RARS, Nandyal for the FIRST year (vide ICAR letter No.2(8)/2003-C.C.I. dated 25.4.2003). During this year, there was drought in Nandyal and Siruguppa centres and the crop growth was affected at various phenological stages.

The trials were laid out in accordance with standard package of practices of cotton cultivation, followed at respective centers, where the evaluations were undertaken. The untreated, acid de-linted seeds of the relevant test hybrids were provided by the above seed companies. The relevant Bt check, local checks were included for comparison and results are furnished below:

### BREEDING EVALUATION

**DESIGN:** Randomised Block Design 2 Replications – 3 ROWS X 6 metre rows with plant protection, based on recommended package of practices of the respective centres with plant protection against all pests and diseases at the prescribed economic threshold levels for each of those biotic stresses in the concerned entries from time to time, based on close monitoring for their incidence and damage. These observations on pests and diseases were also recorded from time to time.

## **PLANT PROTECTION EVALUATION**

DESIGN: Randomised Block design 2 Replications – 3 ROWS X 6 metre rows with no plant protection measures against prevalent bollworms and diseases. However, protection against sap sucking pests in respective entries, based on the recommended practices of respective centres was made. These observations on pests and diseases were also recorded from time to time.

## **RESULTS OF EVALUATIONS**

The Breeding and Plant Protection evaluations were undertaken and the data recorded in the designated five centers. The results are given below in this report.

### **BREEDING EVALUATION**

The breeding evaluation concentrated on various observations on plant biometric characters such as number of monopodia per plant, number of sympodia per plant, nodes per plant, mean length of sympodia, number of fruiting points per sympodium, number of green bolls per plant at harvest, number of burst bolls per plant at harvest, mean boll weight, seed index, Lint index, mean seed cotton yield per plant and per plot and final yield (calculated) of seed cotton yield per hectare in addition to the fibre length, strength and micronaire of the entries tested. The Germination data of the Breeding is given below. The general plant stand of all entries was quite good, as seen from the following tables.

### **Germination Data**

The germination of the genotypes was reasonably good in all locations and the plant stand was quite good, as is shown below. It was found out that NECH.4R of M/S Nath seeds Pvt. Ltd., Aurangabad turned out to be hirsutum x barbadense hybrid which was to have been separately entered in that category of trials. Due to the late detection of this hybrid by centres, the results of the same are not given in this report.

### Germination % under Breeding Evaluation

| Entry          | Siruguppa | TNAU      | Nandyal    | Lam Guntur | Dharwad    | Mean      |
|----------------|-----------|-----------|------------|------------|------------|-----------|

## Seed Cotton Yield (kg/ha) - under Protected Condition

The seed cotton yield data is given below. it is found that under protection against sap sucking pests, the mean seed cotton yield of the zone was at the maximum in MRC.7351X (2692 kg/ha), MRC.7228X (2637 kg/ha), MRC.6100 (2186 kg/ha), GK 208 (2159 kg/ha), RCH.371 (2120 kg/ha) and BRAHMA (2105 kg/ha). The seed cotton yield in the case of certain hybrids at Siruguppa and Nandyal was low due to drought conditions.

### Fibre quality parameters of the test Bt hybrids

The fibre property was assessed and it was found that there were test hybrids such as 2-62 VIP, JKCH.99, Eswar, ACH.11-1, RCH. 371, PRCH.101, PRCH.103, NPH.2270, NPH.2171, NPH.2250, GK.209 and MECH.162Bt (check hybrid) recorded a mean ratio of 0.8 between strength and length. The details of the various important parameters are given below.

The table below compares the fibre strength and tenacity values across the respective micronaire values. It is seen that all the hybrids want in fibre strength commensurate with the span length. As is stipulated in All India Coordinated Cotton Improvement Project final stages of evaluations of genotypes, the full scale mill test could only bring out the merit of fibre, as stipulated by SITRA (South India Textile Research Association, Textile Ministry) norms.

#### Comparative mean values of span length, fibre strength and micronaire data

| Entry                | Span length (mm) | Fibre tenacity (g/tex) | Micronaire |

## PLANT PROTECTION EVALUATION - Protected Condition

The mean Jassid incidence in the zone in the 37 test hybrids was assessed and given below. All the hybrids were seen to be susceptible to this pest, warranting chemical insecticide spraying.

### **Jassids ( average of 3 leaves/plant)**

## American bollworms

The American bollworm incidence was quite negligible in this zone during 2004 season and hence proper assessment of the reaction of these 37 hybrids could not be undertaken. The following data shows the poor incidence in this zone.

| Entry       | Siruguppa     | TNAU          | Nandyal |               | Lam Guntur |               | Mean Number/ plant |

## Locule damage (%)

The percent locule damage was seen to be low in most of the hybrids. In some cases, it has been recorded at a range of 11.0 to 13.3 as given in bolded figures below. The check hybrid, Bunny recorded 15.5% locule damage. Some of the entries such as Bunny VIP, ACH-33-1, NPH.2250 (14.3%) recorded 13.3% locule damage.

## Open boll damage (%)

The Pink bollworm damage was indicated by the open boll damage measurements in these hybrids in this zone. The mean values are presented below. It is found that hybrids such as NRECH.2R and PRCH. 101 (11.1%) had high damage in comparison to Bt and non-Bt check hybrid. Other test hybrids also recorded higher than the Bunny check hybrid.

## Number of sprays undertaken under PROTECTED conditions

Most of the hybrids needed 3.5 to 4.0 sprayings of insecticides to counter the sap sucking pests in breeding evaluation. These hybrids were seen to be susceptible to various sap sucking pests and demanded protection at various phenological stages.

#SP-sucking pests, \* BW-Bollworms

## PLANT PROTECTION EVALUATION- Unprotected Condition

### **Jassids (average of 3 leaves/plant)**

The mean Jassid incidence, under unprotected condition was assessed in the zone in the 37 test hybrids and given below. All the test hybrids were susceptible to this pest.

\*TV-transformed values

The mean whitefly population in the zone in the 36 test hybrids and given below. All the hybrids were seen to be susceptible to this pest. The population of whitefly was quite low in 2004 season in this zone.

The Spotted bollworm was sporadic in this zone. However, they were seen to infest the Bt test hybrids, as seen below.

| Entry       | Whitefly (average of 3 leaves/plant) |         |        |            |        | Spotted Bollworm |        |         |

### American bollworm

The American bollworm incidence was quite negligible under unsprayed conditions too in this zone during 2004 season and hence proper assessment of the reaction of these 37 hybrids could not be undertaken. The following data shows the poor incidence in this zone.

| Entry       | Siruguppa     | TNAU          | Nandyal |               | Lam Guntur |               | Dharwad       | Mean Number/ plant |

\*TV-transformed values

### Locule damage (%)

Under unprotected conditions, the locule damage was quite high, as indicated in the following table. The gene action was amiss in these test hybrids and Pink bollworm damage was high; it may be noted that the Spotted and American bollworms were very low in population during this season.

\*TV-transformed values

The bolded rows provide the indication of poor gene action in reducing the Pink bollworm damage below desirable levels.

## Open boll damage (%)

The Pink bollworm damage, indicating open boll damage also shows that most of these hybrids in this zone did not have gene action to reduce this damage due to Pink bollworm. The percent open boll damage was ranging between 13.1 to 29.8% in test hybrids. The check non-Bt hybrid had 26.7%.

The yield in protected plots was far superior to the entries in unprotected conditions. The following table provides the mean seed cotton yield under both the conditions. It is seen that these Bt hybrids need insecticide support to provide appreciable seed cotton yield in this zone.

**Mean seed cotton yield under both protected and unprotected conditions**

| Entry            | Mean Yield under protected condition (kg/ha) | Mean Yield under unprotected condition (kg/ha) |

## PLANT PATHOLOGY EVALUATION

The 37 Bt test hybrids along with two Bt and one non-Bt checks were evaluated during this year (2004 - 05) for their reaction against Alternaria leaf spot and Grey mildew in the Dharwad, Siruguppa, Lam (Guntur) and Coimbatore centres; against bacterial blight at Dharwad and Siruguppa and against Helminthosporium and Cercospora leaf spots at Lam.

### Alternaria leaf spot

There was very severe incidence of this disease at the Dharwad and Siruguppa centres and all the forty hybrids were found susceptible to this disease (Grade 4). In the Lam centre, there was moderate disease incidence viz., 11.33 to 21.66 per cent in the breeding trials and 17.00 to 30.60 per cent in the entomology trials. In the Coimbatore trials, few hybrids viz., NECH 2R, NECH 4R, JKCH 99, ESWAR, NCS 145, BRAHMA and NPH 2171 did not show any symptoms of the disease under in both breeding and Plant protection evaluations, as seen below.

### Alternaria leaf spot disease (Percent Disease Incidence)

| Name of entry | Dharwad |    | Siruguppa |    | Coimbatore |       |             |       | LAM              |                  |

### Bacterial blight

All 40 hybrids showed susceptibility to this disease at Dharwad. At Siruguppa, few hybrids showed resistant reaction. This may be due to the low incidence of the disease at this centre.

**Bacterial blight disease (Per cent Disease Incidence)**

**Grey mildew**

Very high incidence of Grey mildew was noticed in the Dharwad and Siruguppa centres and all the 40 hybrids were found susceptible (Grade 3 - 4) to this disease. In the Lam centre, the disease incidence varied from 12.91 to 29.33 per cent and 16.33 to 29.33 per cent respectively breeding and entomology trials. At this centre also, all hybrids were found to be equally susceptible. In Coimbatore, very low incidence of the disease was noticed and the

hybrids viz., NECH 2R, NECH 3R, 2-62VIP, JKCH 99, NCS 913, Dhanwan, Brahma, KDCHH 9632, KDCHH 531X, NPH 2171, NPH 2250, GK 207, GK 208, GK 209, RCH 2 Bt, MECH 162 Bt and Bunny were free from this disease. The last three hybrids are known to be susceptible for this disease.

### Conclusions:

- ❖ The data on various parameters of evaluations of 36 test hybrids show that these hybrids are susceptible to sap sucking pests. The gene action to reduce Pink bollworm damage was not evident since high percentage of open boll damage was recorded in most of the test entries.
- ❖ The fibre quality data of these hybrids do not provide enough evidence that they conform to SITRA norms that is now accepted as the yard-stick for achieving defined yarn yield and quality. Confirmation of this through full scale mill test is desirable to recommend the promising hybrids for cultivation by farmers in this zone.
