Dadhwal, K.S., Pratap Narain and Dhruva Narayana, V.V. 1986. Root effects of trees on field boundary can be eliminated by trenching. *Indian Fmg.*, 36(1): 43-44.

Investigates the results of a study conducted at Dehradun to know the effect of boundary plantation of *Eucalyptus* hybrid on the yield of maize and wheat. It was found that by digging a trench by the side of the *Eucalyptus* trees, the root effects on wheat were minimised to marked extent while in case of maize, such effects were insignificant. This was attributed to high rainfall during *kharif* season under Dehradun conditions.
