An alternate method of utilising the rainfall data from ordinary raingauges in preparing iso-erodent maps on annual and seasonal basis has been presented. Due to the presence of

data from a large number of ordinary raingauges and in view of the simple methodology suggested, extensive planning of the soil conservation measures at the district level can be effectively achieved. The paper presents the annual and seasonal maps showing Isoplaths of EI_{30} and their scope and utility in countrywide planning is discussed.
