# Land Resource and Hydrological Inventory of Yaragal Sub-watershed for Watershed Planning and Development Yadgir Taluk, Yadgir District, Karnataka (AESR 6.2)

Sujala – III

Karnataka Watershed Development Project- II

Funded by World Bank

ICAR - National Bureau of Soil Survey and Land Use Planning, Bangalore Watershed Development Department, Govt. of Karnataka, Bangalore

### **About ICAR - NBSS&LUP**

The National Bureau of Soil Survey and Land Use Planning (ICAR-NBSS&LUP), Nagpur, a premier Institute of the Indian Council of Agricultural Research (ICAR), was set up during 1976 with the objective to prepare soil resource maps at national, state and district levels and to provide research inputs in soil resource mapping and its applications, land evaluation, land use planning, land resource management, and database management using GIS for optimizing land use on different kinds of soils in the country.

The Bureau has been engaged in carrying out soil resource survey, agro-ecological and soil degradation mapping at the country, state and district levels for qualitative assessment and monitoring the soil health towards viable land use planning. The research activities have resulted in identifying the soil potentials and problems, and the various applications of the soil surveys with the ultimate objective of sustainable agricultural development. The Bureau has the mandate to correlate and classify soils of the country and maintain a National Register of all the established soil series. The Institute is also imparting in-service training to staff of the soil survey agencies in the area of soil survey, land evaluation and soil survey interpretations for land use planning. The Bureau in collaboration with Panjabrao Krishi Vidyapeeth, Akola is running post-graduate teaching and research programme in land resource management, leading to M.Sc. and Ph.D. degrees.

### How to read and use the Atlas

The Land Resource Inventory of Yaragal Sub-watershed (Yadgir Taluk, Yadgir District) for Watershed Planning (AESR 6.2) was undertaken to provide comprehensive site-specific cadastral level information useful for farm level planning and integrated development of the area under Sujala – III, Karnataka Watershed Development Project-II.

This atlas contains the basic information on kinds of soils, their geographic distribution, characteristics and classification. The soil map and soil based thematic maps derived from soils data on soil depth, soil gravelliness, slope, land suitability for various crops and land use management maps are presented on 1:12,500 scale. The maps of fertility status (soil reaction, organic carbon, available phosphorus, available potassium, available sulphur, available calcium, available copper, available manganese, available zinc, available iron, available boron and salinity (EC) on 1:12,500 scale were derived from grid point sampling of the surface soils from the watersheds.

The atlas illustrates maps and tables that depict the soil resources of the watershed and the need for their sustainable management.

The user, depending on his/her requirement, can refer this atlas first by identifying his/her field and survey number on the village soil map and by referring the soil legend which is provided in tabular form after the soil map for details pertaining to his/her area of interest.

The atlas explains in simple terms the different kinds of soils present in the watershed, their potentials and problems through a series of thematic maps that help to develop site-specific plans as well as the need to conserve and manage this increasingly threatened natural resource through sustainable land use management. The Land Resource Atlas contains database collected at land parcel/ survey number level on soils, climate, water, vegetation, crops and cropping patterns, socio-economic conditions, marketing facilities *etc.* helps in identifying soil and water conservation measures required, suitability for crops and other uses and finally for preparing a viable and sustainable land use options for each and every land parcel.

For easy map reading and understanding the information contain in different maps, the physical, cultural and scientific symbols used in the maps are illustrated in the form of colors, graphics and tables.

### Physical, Cultural and Scientific symbols used in the Atlas

Each map in the atlas sheet is complemented with the physical, cultural and scientific symbols to facilitate easy map reading.

#### Inset map

*Inset provided in each map conveys its* strategic location i.e. Taluk, Sub-watershed and Sub-watershed.

# YADGIR TALUK YARAGAL SUB-WATERSHED Yadgir Taluk Yagapur Tanda Yagapur Tanda

#### Legends and symbols

Two legends accompany each map, map reference, which depicts geographic features and a thematic legend which portrays spatial information. Picking up the symbol and colour of a particular enables one to go to the legends to obtain the required information.

#### References Road/Cart track Streams/Drainage Habitation Waterbody Sub-watershed boundary Micro-watershed boundary Village boundary

Soil Phase

#### Map colours

Different shades of colours are used as an aid to distinguish the different classes of soils, crop suitability and other maps.

#### Map key

There are many thematic types to be differentiated on the map solely based on colour. Therefore soils and suitability types and their limitations are distinguished by colours with a combination of alpha-numeric characters.

Area in ha (%) Soil Phase

#### S1- Highly Suitable S2- Moderately Suitable S3- Marginally Suitable N1- Currently Not Suitable n- nutrient availability

Limitations

z- excess salt/calcareousness

t- texture

Map title

The soil map may be read at different levels. The most detailed level is that of the soil phase. Soil phases are distinguished within soil series mainly based on differences in surface of soil texture, slope, gravelliness, erosion ,etc.

Map title conveys the relevance of

geographical location and watershed

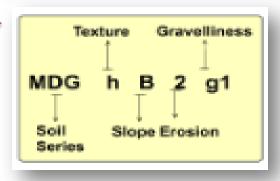

thematic information presented

along with a graphical scale,

details in text form.

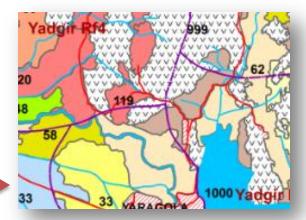

# SOILS Yaragal Sub-watershed (4D5B2H: Area - 5062.97 ha) YADGIR TALUK & DISTRICT

#### Soil Units

#### Soil and plot boundaries

Soil units shown on the map are represented by both the color and a numeral. The soil boundaries superimposed on land parcel revenue survey number boundaries to visualize its spatial extent.

#### 1. Introduction

Land is a scarce resource and basic unit for any material production. It can support the needs of the growing population, provided they use land in a rational and judicious manner. But what is happening in many areas of the state is a cause for concern to anyone involved in the management of land resources at the grassroots level. In India the area available for agriculture is about 51 per cent of the total area and more than 60 per cent of the people are still relying on agriculture for their livelihood. The limited land area is under severe stress and strain due to increasing population pressure and competing demands of various land uses. Due to this, every year there is a significant diversion of farm lands and water resources for non-agricultural purposes. Apart from this, due to lack of interest for farming among the farmers in many areas, large tracts of cultivable lands are turning into fallows and this trend is continuing at an alarming rate.

The watershed management programs are aimed at designing suitable soil and water conservation measures, productivity enhancement of existing crops, crop diversification with horticultural species, greening the wastelands with forestry species of multiple uses and improving the livelihood opportunities for landless people.

The objectives can be met to a great extent when an appropriate Natural Resources Management (NRM) plan is prepared and implemented. It is essential to have site specific Land Resources Inventory (LRI) indicating the potentials and constraints for developing such a site specific plan. LRI can be obtained by carrying out detailed characterization and mapping of all the existing land resources like soils, climate, water, minerals and rocks, vegetation, crops, land use pattern, socio-economic conditions, infrastructure, marketing facilities and various schemes and developmental works of the government. From the data collected at farm level, the specific problems and potentials of the area can be identified and highlighted, conservation measures required for the area can be planned on a scientific footing, suitability of the area for various uses can be worked out and finally viable and sustainable land use options suitable for each and every land holding can be prescribed to the farmer and other land users of the area.

The major landforms identified in the Sub-watershed are uplands and low lands. The database was generated by using cadastral map of the village as a base along with high resolution satellite imagery (IRS LISS IV and Cartosat-1). The objectives of the land resource survey, carried out in the Yaragal Sub-watershed covering an area of 5062.97 ha are indicated below.

- Detailed characterization of all the land resources like soil, water, land use, cropping pattern and other resources available at parcel level in the village.
- Delineation of homogenous areas based on soil-site characteristics into management units.
- Collection and interpretation of climatic and agronomical data for crop planning.
- Identification of problems and potentials of the area and strategies for their management.
- Assessment of the suitability of land resources for various crops and other uses.
- Establishment of village level digital land resources database in a GIS framework.
- Enable the watershed and other line departments to prepare an action plan for the integrated development of the watershed.

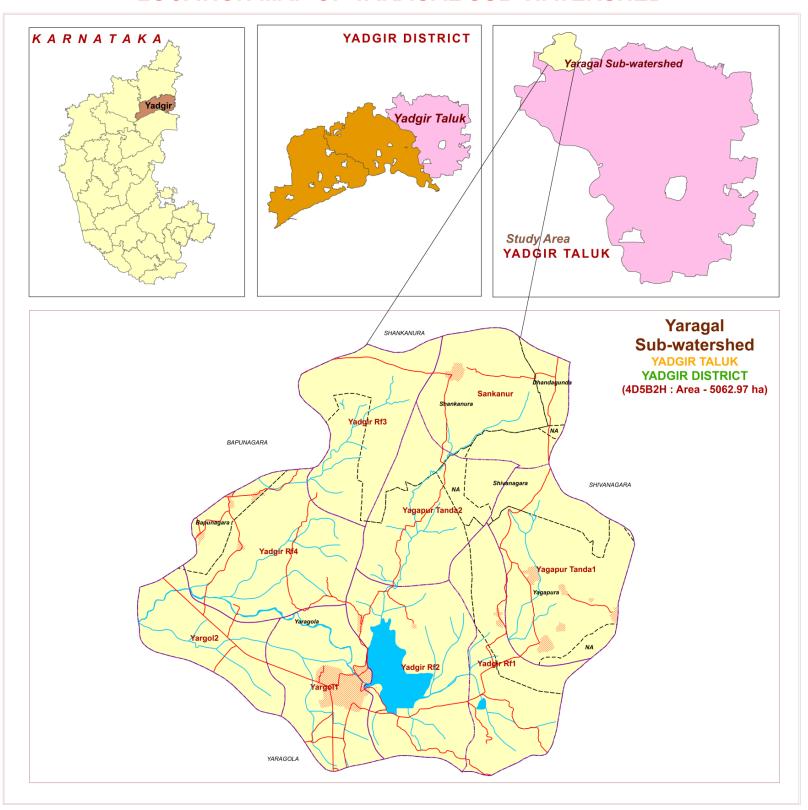

### 2. General Description of Sub-watershed

The Yadgir, popularly called as "Yadavagiri" by the local people, district came to existence on  $30^{th}$  Dec 2009 by carving out of erst-while Kalaburagi district of Karnataka with a geographical area of 5234.4 square kilometers, located in the northern part of the state. It lies between north latitudes'  $17^{0}0' - 16^{0}55'$  and east longitudes  $77^{0}7' - 77^{0}0'$ . The climate of the district is very hot and dry. The district has an average annual rainfall of 636 mm. Soils are well drained red sandy loam to medium deep black soils. This may be the weathering product of gneissic and granite terrain. Agriculture in Yadgir district is dependent upon rainfall, irrigation tanks, wells, streams etc. The major agricultural crops grown are Jowar, Groundnut, Cotton, Red gram, Bengal gram etc.

As a pilot study, **ICAR-NBSS&LUP**, **Bangalore** carried out the generation of Sub-watershed (SWs) - LRI for the Yaragal SWs in Yadgir taluk, Yadgir district. It was selected for data base generation under Sujala III project. The Yaragal Sub-watershed (code— 4D5B2H) is covering an area of 5062.97 ha and spread across Shivanagara, Yaragola, Bapunagara and Shankanura villages. This sub-watershed encompasses of 9 MWs namely Sankanur (4D5B2H1a), Yadgir Rf-1 (4D5B2H1d), Yadgir Rf-2 (4D5B2H1e), Yadgir Rf-3 (4D5B2H2a), Yadgir Rf-4 (4D5B2H2b), Yagapur Tanda-1 (4D5B2H1c), Yagapur Tanda-2 (4D5B2H1b), Yargol-1 (4D5B2H2c) and Yargol-2 (4D5B2H2d). Land Resource Inventory (LRI) was generated for all the nine micro-watersheds.

### 2.1. Location and Extent

#### **LOCATION MAP OF YARAGAL SUB-WATERSHED**

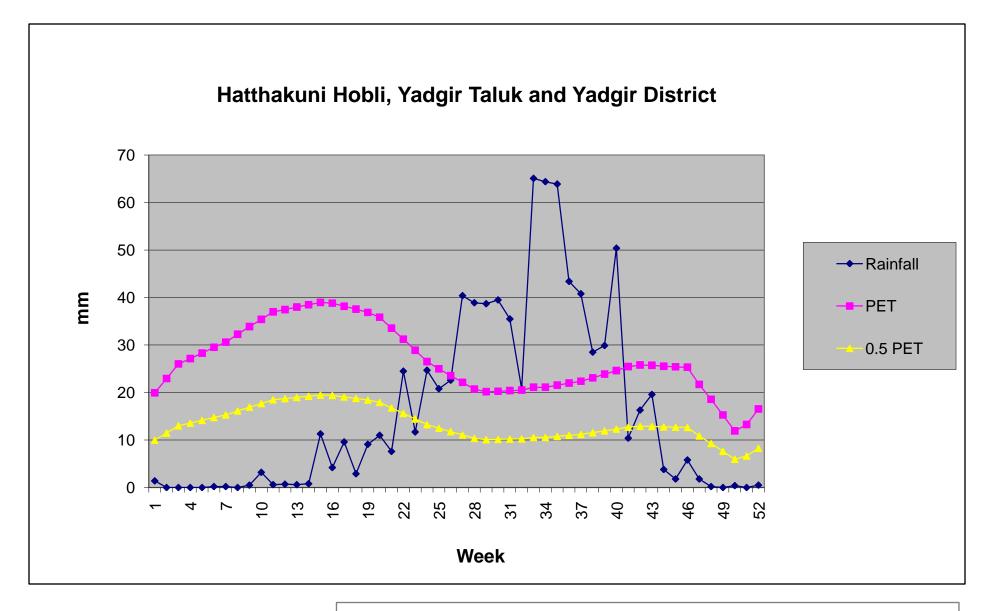

Yaragal sub-watershed (Yadgir Taluk, Yadgir District) is located between 16<sup>0</sup>53'14"-16<sup>0</sup>57'54" North latitudes and 77<sup>0</sup>1'48"- 77<sup>0</sup>7'7" East longitudes, covering an area of about 5062.97 ha.

Agro Ecological Sub Region (AESR) 6.2: Central and Western Maharashtra Plateau and North Karnataka Plateau and North Western Telangana Plateau, hot moist semi-arid ESR with shallow and medium loamy to clayey Black soils (medium and deep clayey Black soils as inclusion), medium to high AWC and LGP 120-150 days.

#### **Agro-climatic Zone 2: North-eastern Dry Zone:**

The total geographic area of this zone is about 1.76 M ha covering 8 taluks of Gulbarga district and 3 taluks of Raichur. Net cultivated area in the zone is about 1.31 M ha of which about 0.09 M ha are irrigated. The mean elevation of the zone is 300-450 m MSL. The main soil type is deep to very deep soils with small pockets of shallow to medium black soils. The zone is cropped predominantly during rabi due to insufficient rainfall (465-785 mm). The principal crops of the zone are jowar, bajra, oilseeds, pulses, cotton and sugarcane.

## 2.2. Climate

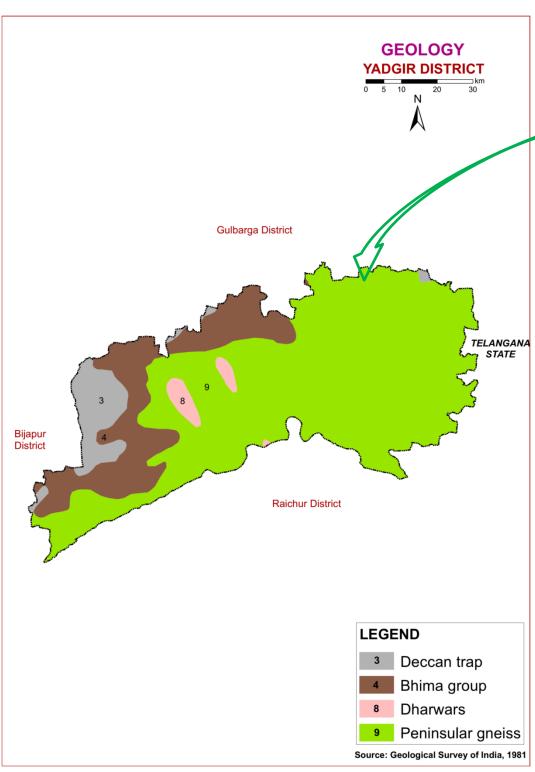

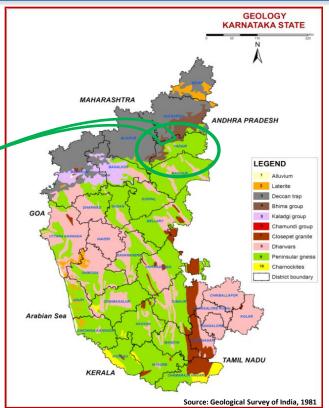

Length of Growing Period (LGP) is varying from June 1<sup>st</sup> week to 3<sup>rd</sup> week of October (120 - 150 days)

Annual Rainfall: 829 mm. in the Hatthakuni Hobli, Yadgir Taluk & District

Source: KSNDMC (1980-2011)

# 2.3. Geology

#### **GEOLOGY - KARNATAKA STATE**

Karnataka forms part of the Peninsular Shield, which is an ancient stable block of the earth's crust. The shield is composed of geologically ancient rocks of diverse origin. These rocks have undergone various degrees of metamorphism and crushing. Overlying these ancient rocks are Proterozoic, lete Creteceous to Palaeocene, Palaeocene to Recent, and Recent sediments.

In the stratigraphic succession of rocks in Karnataka the Archaean group is the oldest, followed by Proterozoic, Mesozoic and Cainozoic formations.

#### **GEOLOGY - YADGIR DISTRICT**

#### **Mesozoic Group**

Towards the end of the Cretaceous Period there was tremendous volcanic activity in the Peninsular part of India with eruption of a series of lava flows which came out through fissures and cracks. This formation is Known as the Deccan Trap.

**Deccan Trap:** The Deccan Trap covers an area of 25,000 sq. km. Eight lava flows have been identified in Karnataka, horizontally overlying the older formations. The thickness of the individual flows averages about five metres. The Deccan Trap is relatively uniform in petrographic character. The most common type is augite basalt. Dominant colour is greyish green; texture ranges from cryptocrystalline to glassy. The rock is often visicular and scoriaceous.

#### **Upper Proterozoic Group**

Formations of the Upper Proterozoic in Karnataka are closepet granites, Chamundi granites, Kaladgi series and Bhima series.

#### **Bhima series**

This series, equivalent to the Kurnool formations, is named after the Bhima river and occurs in Bijapur and Gulbarga districts. It covers an area of about 4200 sq. km and is overlain by the Deccan trap. The group consists of horizontal, unfossiliferous, unmetamorphosed sedimentary rocks such as sandstones, green, purple and black shales, and cream and bluish limestones. The thickness is about 477 metres.

#### **Dharwar schists**

The Dharwar schists consist of a complex series of crystalline schists associated with ultrabasic rocks such as amphibolite, peridotites and dunites. These schists are found in long, narrow bands of various dimensions running NW-SE through the Peninsular Gneiss. The Dharwars are divided into Upper and Lower.

Upper Dharwars are equivalent to the Archaean to Lower Proterozoic, and are divided into Bababudan. Lower Dharwars occur in Mysore district and include amphibolite schist, quartzite, ironstone and marble.

#### **Peninsular Gneiss**

Exposed over a large area of Karnataka in all the districts except Bidar is the Peninsular Gneiss which is a heterogeneous mixture of several types of granitic rocks such as banded gneisses, granitic gneisses, granites and gneissic granites, granodiorites and diorites. The banded gneisses consist of white bands of quartz-feldspar alternating with dark bands of biotite, hornblende, and minor accessories. The granite group includes granites of all shades with varying composition. Peninsular gneiss seems to have formed by the granitization of the older rocks.

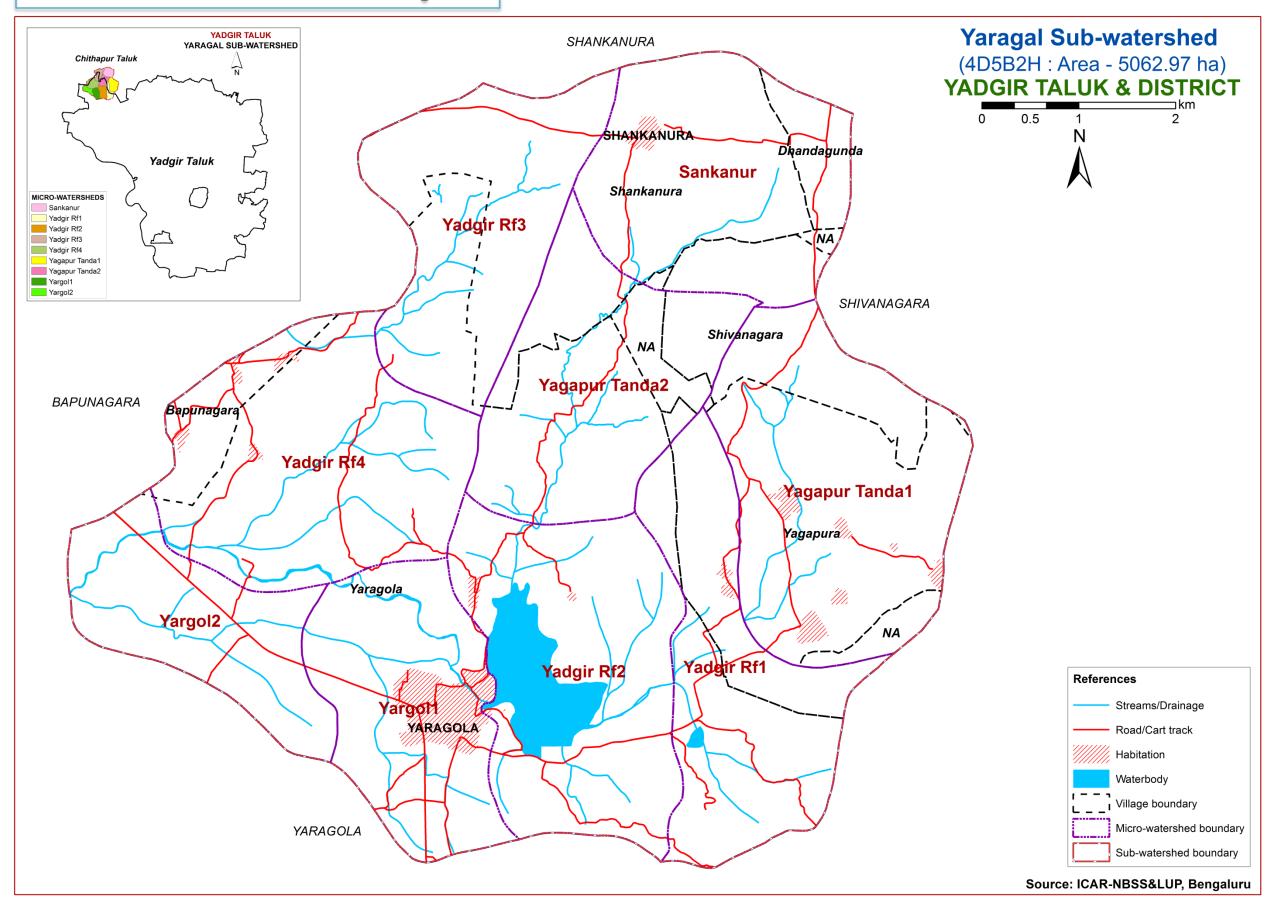

# 3. Survey Methodology

### Sequence of activities in generation of LRI

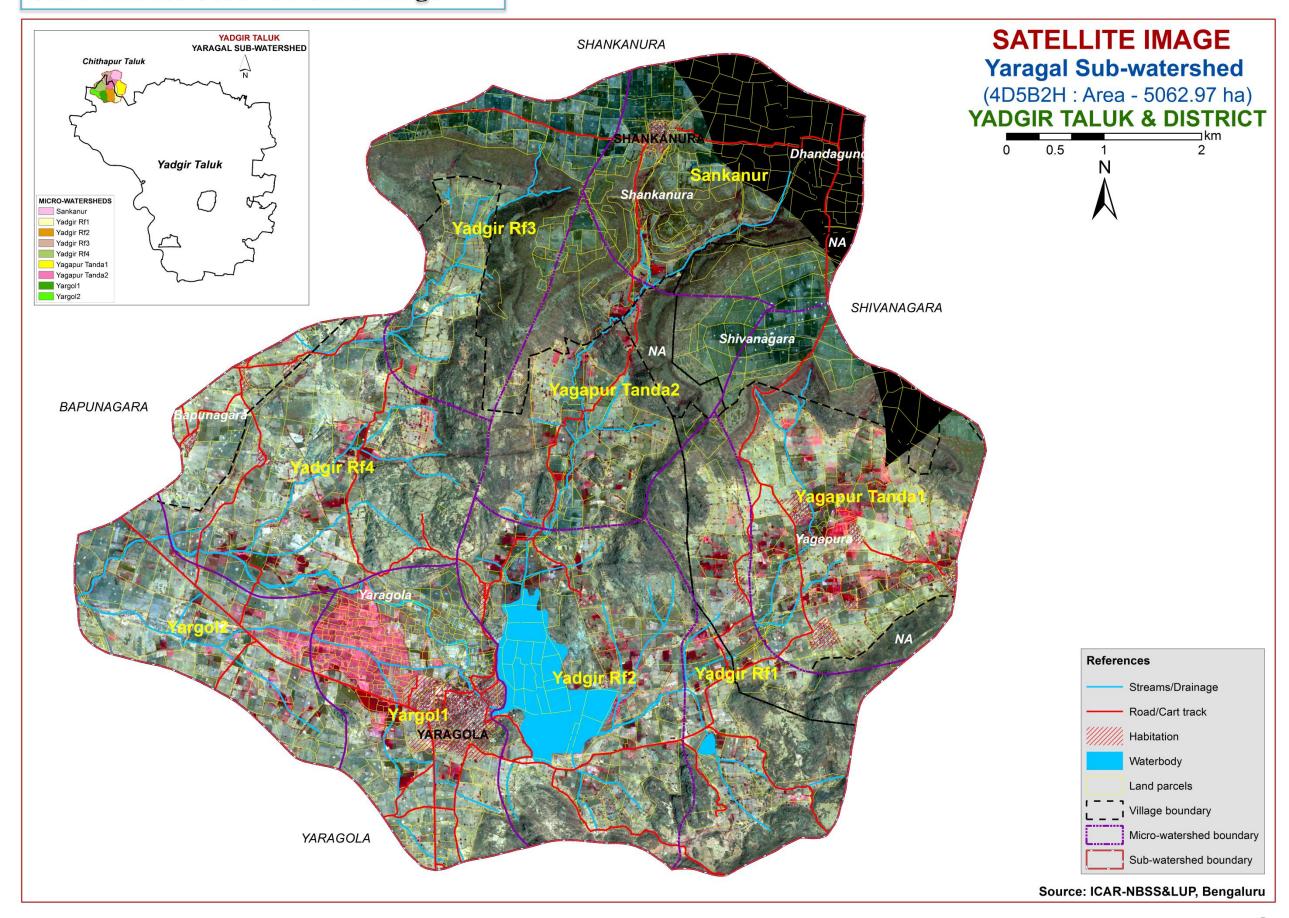

- Traversing the watershed using cadastral maps and imagery as base
- Identifying landforms, geology, land use and other features
- Selecting fields representing land units
- Opening profiles to 2 m depth
- Studying soil and site characteristics
- Grouping similar areas based on their soil-site characteristics into land management units
- Preparation of crop, soil and water conservation plan
- Socio-economic evaluation

The required site and soil characteristics are described and recorded on a standard proforma by following the protocols and guidelines given in the soil survey manual and field guide. Collection of soil samples from representative pedons for laboratory characterization and collection of surface soil samples from selected fields covering most of the management units for macro and micro-nutrient analysis is being carried out (320m grid intervals). Further processing of data at chemical lab and GIS lab are carried out to generate various thematic maps for each of the study area.

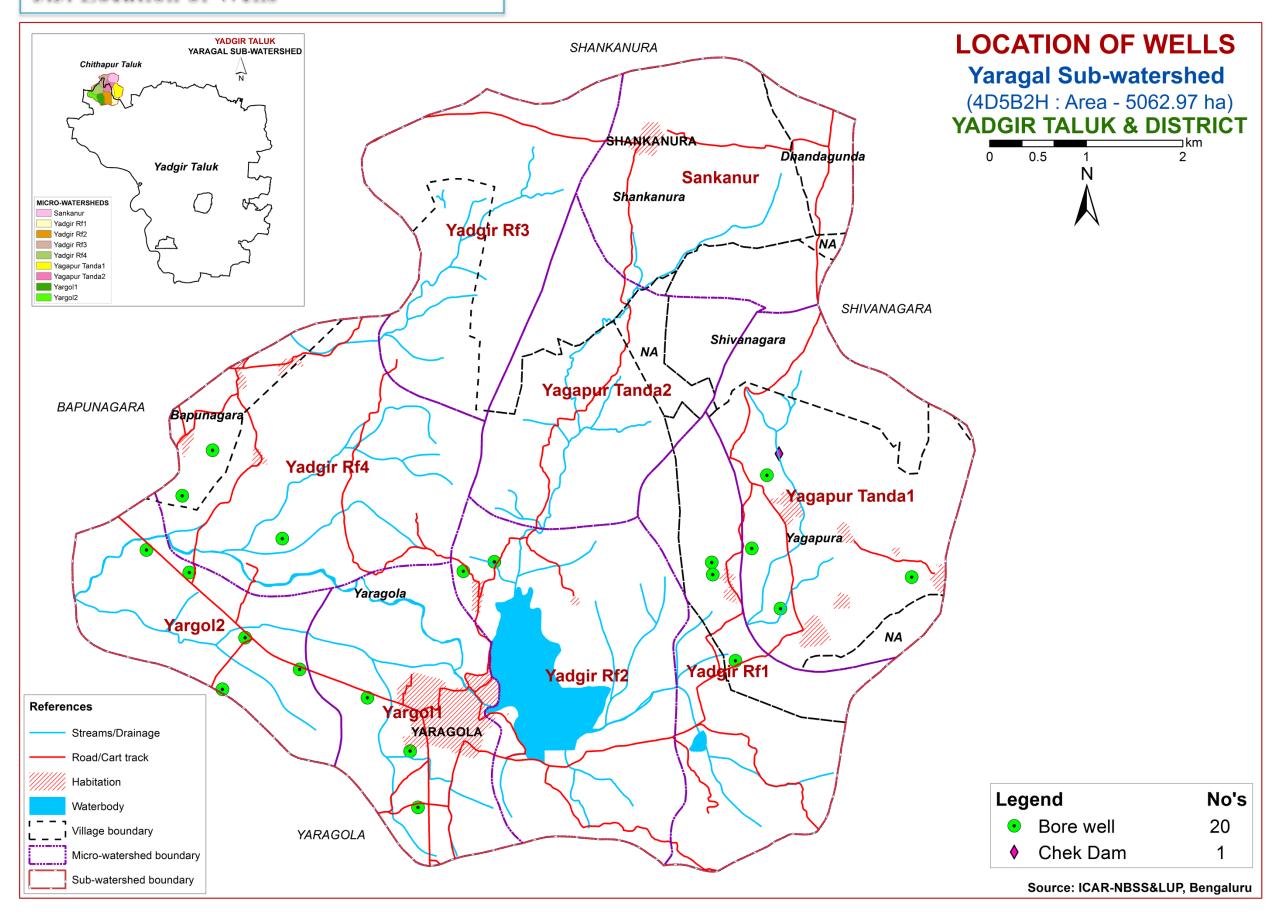

# 3.1. Database Used - Cadastral map

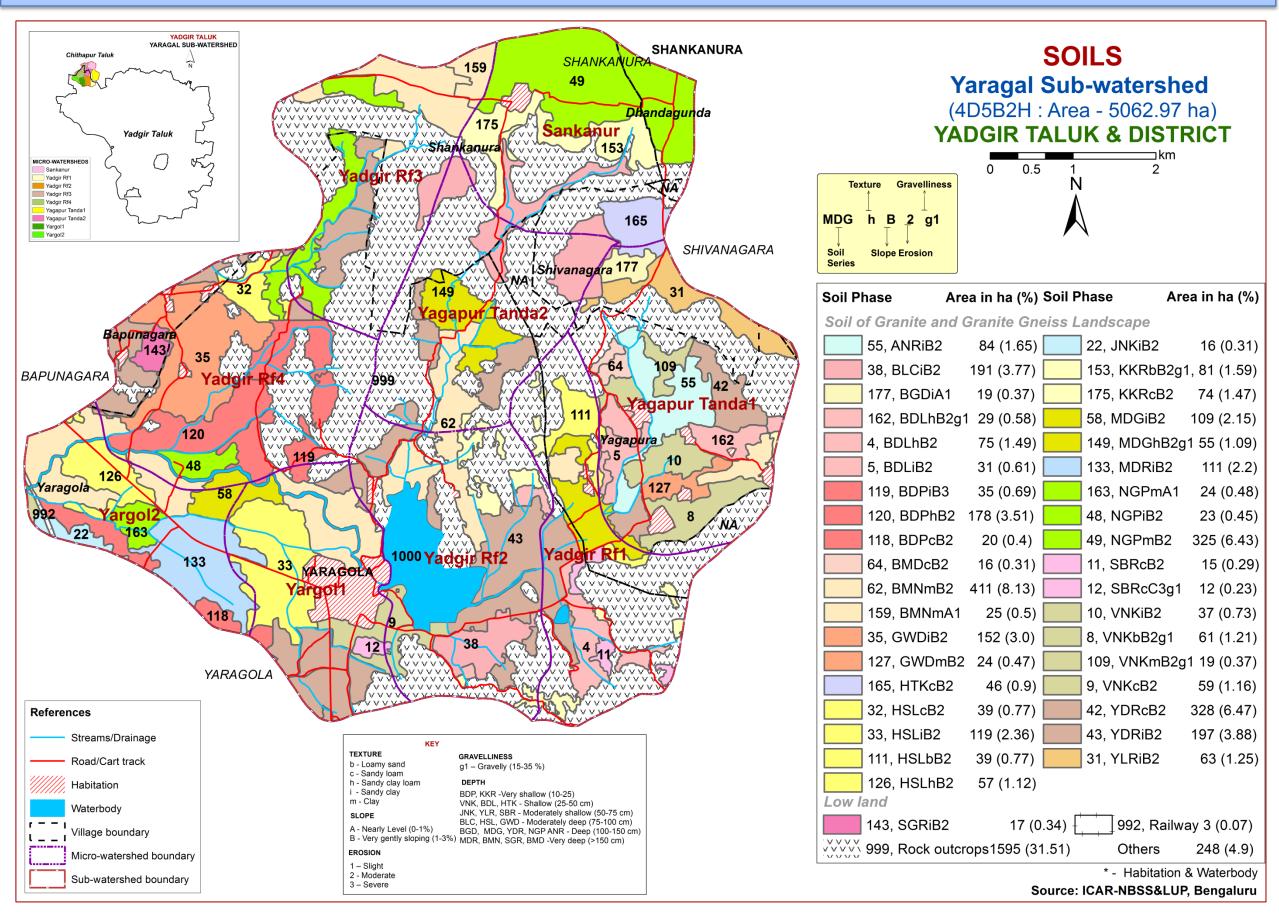

### 3.2. Database Used - Satellite Image

### 3.3. Location of Wells

### 4. The Soils

## 4.1 Mapping unit description of Yaragal (4D5B2H) Sub-watershed in Yadgir Taluk, Yadgir district

Soil map unit No*	Soil Series	Soil Phase Symbol	Mapping Unit Description	Area in ha (%)	
		Soils of	Granite and Granite gneiss Landscape		
	BMD	Bomraldoddi soils are very deep (>150 cm), well drained, have dark reddish brown to dark grey, reddish brown, dark brown and yellowish red, slightly calcareous sandy clay loam soils occurring on nearly level to very gently sloping uplands under cultivation			
64		BMDcB2	Sandy loam surface, slope 1-3%, moderate erosion	16 (0.31)	
	BMN	1	shimanahalli soils are very deep (>150 cm), moderately well drained, have very dark gray, calcareous racking clay black soils occurring on very gently sloping uplands under cultivation		
159		BMNmA1	Clay surface, slope 0-1%, slight erosion	25 (0.5)	
62		BMNmB2	Clay surface, slope 1-3%, moderate erosion	411 (8.13)	
	MDR	1	Madhwara soils are very deep (>150 cm), well drained, have very dark gray to very dark brown, slightly calcareous sandy clay loam soils occurring on nearly level to very gently sloping uplands under cultivation		
133		MDRiB2	Sandy clay surface, slope 1-3%, moderate erosion	111 (2.2)	
	ANR	Anur soils are deep (100-150 cm), moderately well drained, have dark gray to dark brown, calcareous sodic clay soils occurring on very gently to gently sloping uplands under cultivation			
55		ANRiB2	Sandy clay surface, slope 1-3%, moderate erosion	84 (1.65)	
	BGD		150 cm) well drained, have brown to dark yellowish brown, slightly calcareous y level to very gently sloping uplands under cultivation	19 (0.37)	
177		BGDiA1	Sandy clay surface, slope 0-1%, slight erosion	19 (0.37)	
	MDG	Mundargi soils are deep (100-150 cm), well drained, have brown to dark yellowish brown, sandy clay loam soils occurring on very gently sloping uplands under cultivation			
149		MDGhB2g1	Sandy clay loam surface, slope 1-3%, moderate erosion, gravelly (15-35%)	55 (1.09)	
58		MDGiB2	Sandy clay surface, slope 1-3%, moderate erosion	109 (2.15)	
	NGP	NGP Nagalapur soils are deep (100-150 cm), moderately well drained, have very dark gray to very dark gray brown, black calcareous cracking clay soils occurring on very gently sloping uplands under cultivation		370 (7.36)	
48		NGPiB2	Sandy clay surface, slope 1-3%, moderate erosion	23 (0.45)	
163		NGPmA1	Clay surface, slope 0-1%, slight erosion	24 (0.48)	
49		NGPmB2	Clay surface, slope 1-3%, moderate erosion	325 (6.43)	
	YDR	Yadgir soils are deep (100-150 cm), well drained, have brown to dark yellowish brown and olive brown, sodic sandy loam soils occurring on very gently sloping uplands under cultivation			
42		YDRcB2	Sandy loam surface, slope 1-3%, moderate erosion	328 (6.47)	
43		YDRiB2	Sandy clay surface, slope 1-3%, moderate erosion	197 (3.88)	

Soil map unit No*	Soil Series	Soil Phase Symbol	Mapping Unit Description	Area in ha (%)
		Soils of G	ranite and Granite gneiss Landscape	
	BLC	Balichakra soils are moderately deep (75-100 cm), well drained, have reddish brown to dark reddish brown, sandy clay loam red soils occurring on very gently sloping uplands under cultivation		
	BLC			
38		BLCiB2	Sandy clay surface, slope 1-3%, moderate erosion	191 (3.77)
	GWD	Gowdagera soils are moderately deep (75-100 cm), moderately well drained, have dark grayish brown to very dark grayish brown, calcareous sodic sandy clay loam soils occurring on very gently sloping uplands under cultivation		176 (3.47)
35		GWDiB2	Sandy clay surface, slope 1-3%, moderate erosion	152 (3.0)
127		GWDmB2	Clay surface, slope 1-3%, moderate erosion	24 (0.47)
	HSL	•	75-100 cm), moderately well drained, have yellowish brown to dark yellowish ay soils occurring on very gently sloping uplands under cultivation	254 (5.0)
111		HSLbB2	Loamy sand surface, slope 1-3%, moderate erosion	39 (0.77)
32		HSLcB2	Sandy loam surface, slope 1-3%, moderate erosion	39 (0.77)
126		HSLhB2	Sandy clay loam surface, slope 1-3%, moderate erosion	57 (1.12)
33		HSLiB2	Sandy clay surface, slope 1-3%, moderate erosion	119 (2.36)
	INIZ	Jinkera soils are moderately shallow (50-75 cm), well drained, have dark brown to very dark grayish brown,		16
	JNK	slightly calcareous sandy clay loam soils occurring on very gently sloping uplands under cultivation		(0.31)
22		JNKiB2	Sandy clay surface, slope 1-3%, moderate erosion	16 (0.31)
	SBR	Sambara soils are moderately shallow (50-75 cm), somewhat excessively drained, have light gray to pink, loamy sand soils occurring on very gently to gently sloping uplands under cultivation		27 (0.52)
11		SBRcB2	Sandy loam surface, slope 1-3%, moderate erosion	15 (0.29)
12		SBRcC3g1	Sandy loam surface, slope 3-5%, severe erosion, gravelly (15-35%)	12 (0.23)
	YLR	Yalleri soils are moderately shallow (50-75 cm), well drained, have brown to reddish brown and dark reddish brown, clay red soils occurring on very gently to gently sloping uplands under cultivation		63 (1.25)
31		YLRiB2	Sandy clay surface, slope 1-3%, moderate erosion	63 (1.25)
	BDL	Badiyala soils are shallow (25-50 cm), well drained, have dark brown to very dark brown and dark yellowish brown, slightly calcareous sandy loam soils occurring on very gently to gently sloping uplands under cultivation		136 (2.6)
4		BDLhB2	Sandy clay loam surface, slope 1-3%, moderate erosion	75 (1.49)
162		BDLhB2g1	Sandy clay loam surface, slope 1-3%, moderate erosion, gravelly (15-35%)	29 (0.58)
5		BDLiB2	Sandy clay surface, slope 1-3%, moderate erosion	31 (0.61)

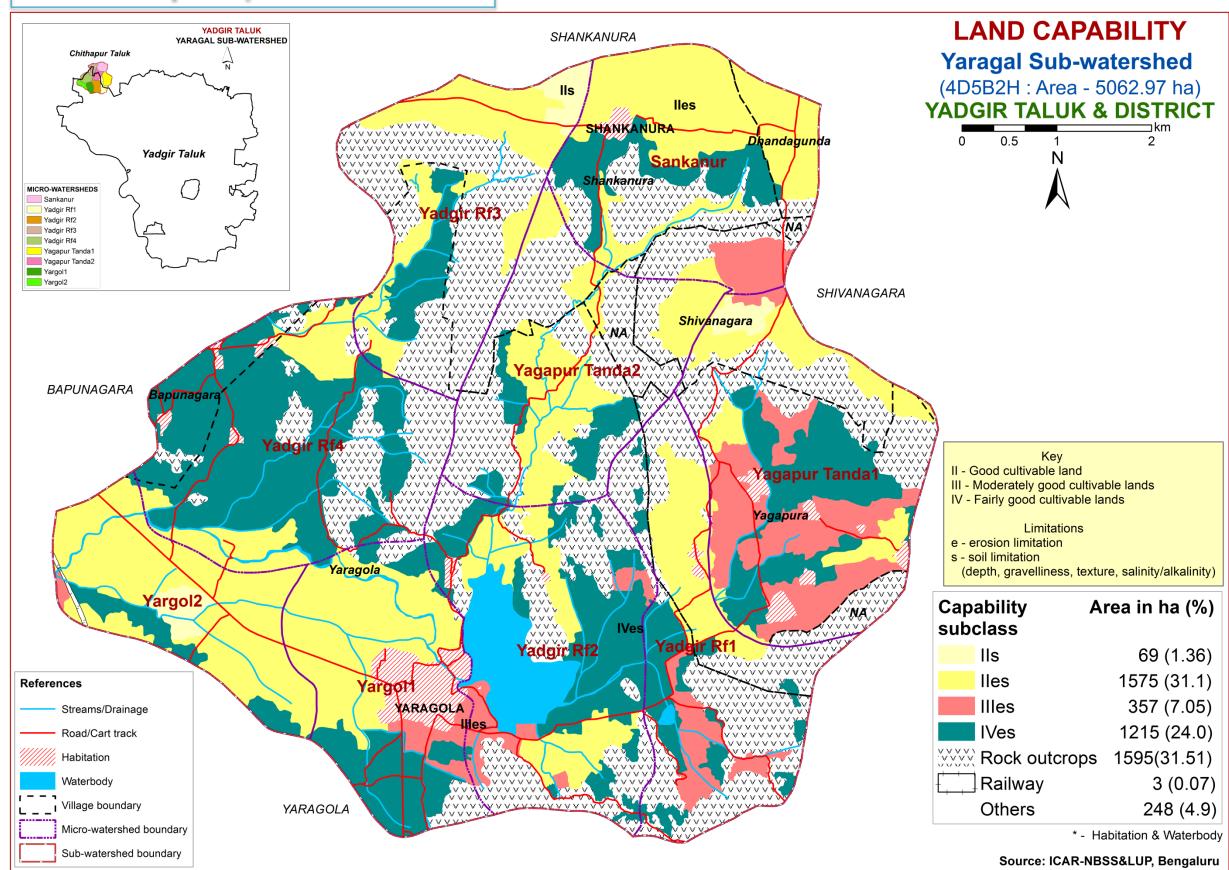

To be continued.... 12

Soil map unit No*	<b>Soil Series</b>	Soil Phase Symbol	Mapping Unit Description	Area in ha (%)

#### 6.7. Available Boron

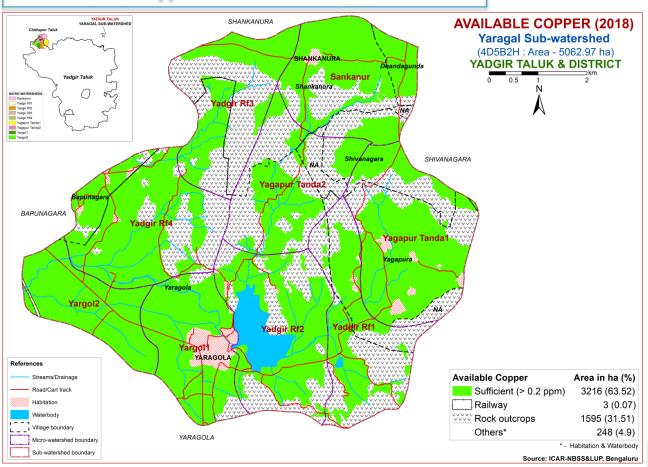

#### 6.8. Available Iron

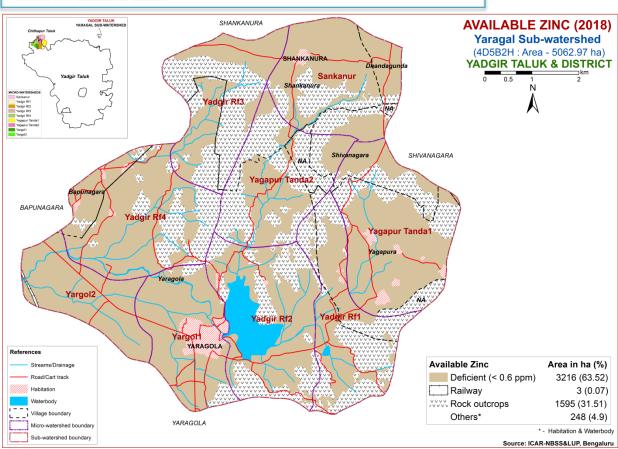

### 6.9. Available Manganese

#### 6.10. Available Copper

#### 6.11. Available Zinc

### 6.12. Correcting the Soil Nutrient Deficiencies

- 1. Reclamation of Salt affected soils
  - a) When the soil is having neutral pH (6.5-7.5), no need of adding amendments (lime or gypsum)
  - b) If the soil pH is <6.5, apply burnt lime to soil as per specifically recommended dosage and again after 2 years proper change has to be made based on soil test results.
  - c) If the soil pH is 7.5-8.5 due to excess calcium content, drain out the excess calcium form the soil with good quality irrigation water.
  - d) If the soil pH is more than 8.5 due to higher sodium content in soil, apply specifically recommended dose of gypsum & drain out the excess salts with good quality irrigation water.
- 2. In case of low & high content of major nutrients in the soil, follow the modifications as given bellow:
  - N: P: K (N: P<sub>2</sub>O<sub>5</sub>: K<sub>2</sub>O) **For low N content**, add 25 % extra to the Recommended Dose of Fertilisers (RDF).

For high N content, reduce 25% from the RDF and apply to soil.

Eg:- if 100kg N, then we have to apply

100+25% for deficient soil.

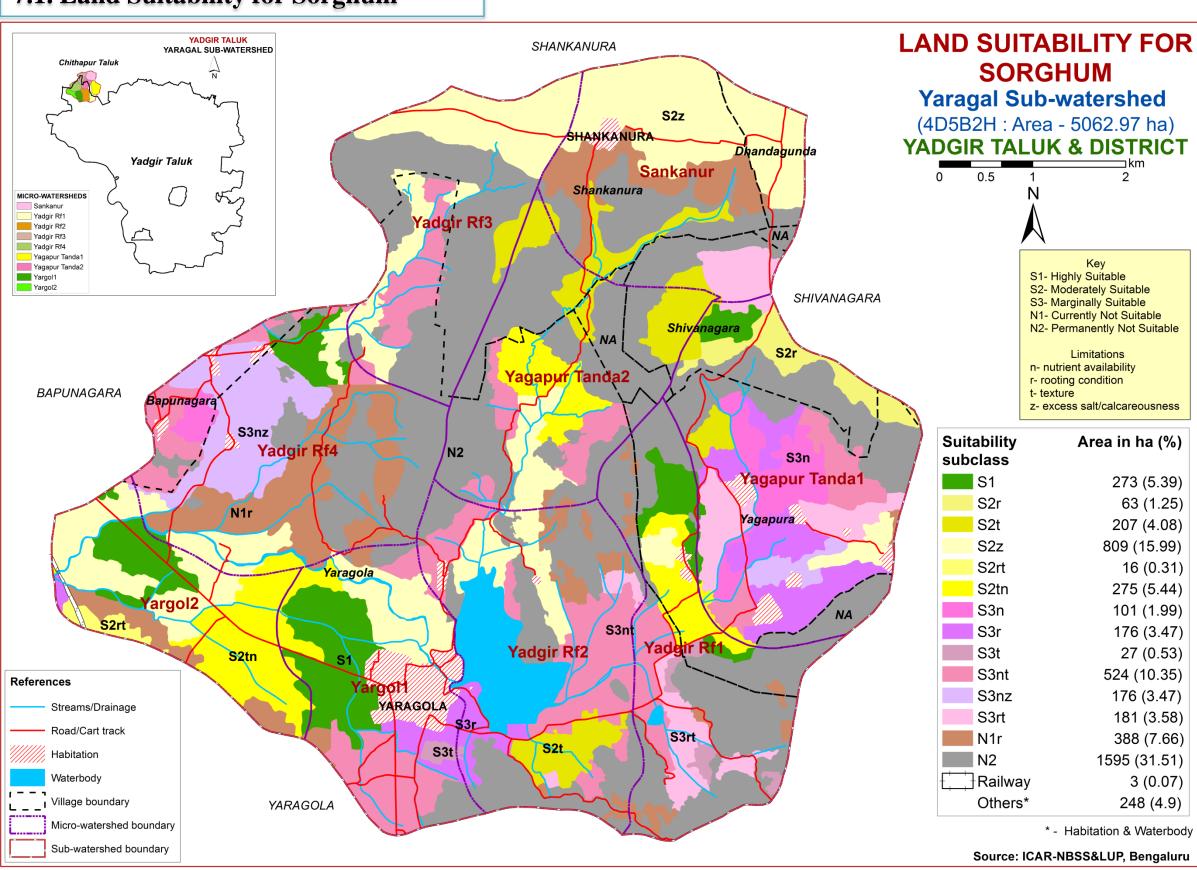

100% for medium available N content soil.

100-25% for higher N content soil.

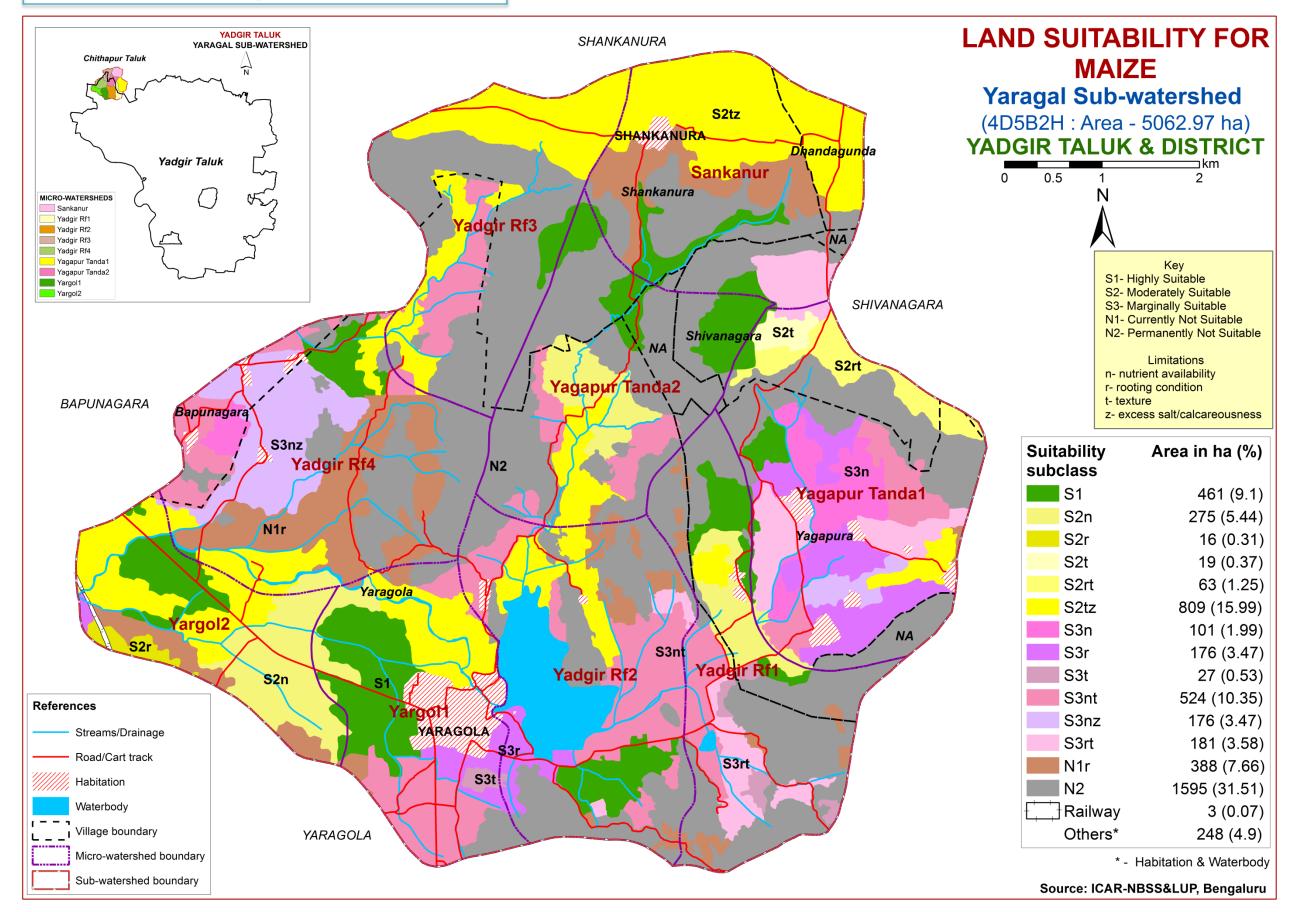

- Follow the same in case of P & K.
- 3. Use or Incorporation of biofertilizers like Rhizobium, Azotobacter, Azospirillum, Phosphate Solubilizing Bacteria and mycorrhiza enhances normal available nutrients in soil to the plants and also reduce the input cost of cultivation.
- 4. For calcium deficient soil, apply N-fertilizers like calcium ammonium nitrate; Gypsum can also supply calcium (CaSO<sub>4</sub>. 2H<sub>2</sub>O)
- 5. Apply 405kg MgSO<sub>4</sub> per ha to the magnesium deficient soil. In case of perennial horticulture crops apply 150-200g/ plant.
- 6. In sulphur deficient acid soils (Humid region) apply phosphorus (in the form of) through SSP & use sulphur coated urea to the crops.
- 7. Apply 30-50kg ferrous sulfate (FeSO<sub>4</sub>) per ha to the iron deficient soils. In case of perennial Horticulture crops apply 3-5g/ litre FeSo<sub>4</sub>/plant as foliar spray.
- 8. Apply 30-40kg/ha manganese sulfate (MnSO<sub>4</sub>) as soil application to the manganese deficient soils. In case of perennial Horticulture crops apply 3-5 g/litre MnSO<sub>4</sub> /plant as foilar application.
- 9. Apply Zinc 10-25 kg/ha –ZnSO<sub>4</sub> soil application to the Zinc deficient soils. In case of perennial Horticulture crops apply 3-5g/ litre foliar application.
- 10. Apply Copper 5-10 kg /ha copper sulfate (CuSO<sub>4</sub>) soil application for the copper deficient soils and for Perennial horticultural crops 3-5g/ litre CuSO<sub>4</sub>/plant as foliar application.
- 11. Apply borax 8-10 kg/ha in boron deficient soils and for Perennial horticultural crops as foliar application 1g / litre.
- 12. Apply molybdenum ammonium molybdate 200-250 gm/ha for Molybdenum deficient soils or dissolve 1g / litre ammonium molybdate for Foliar spray.
- 13. Soil sampling and testing needs to be done at every 2-3 years interval.

#### **INTRODUCTION**

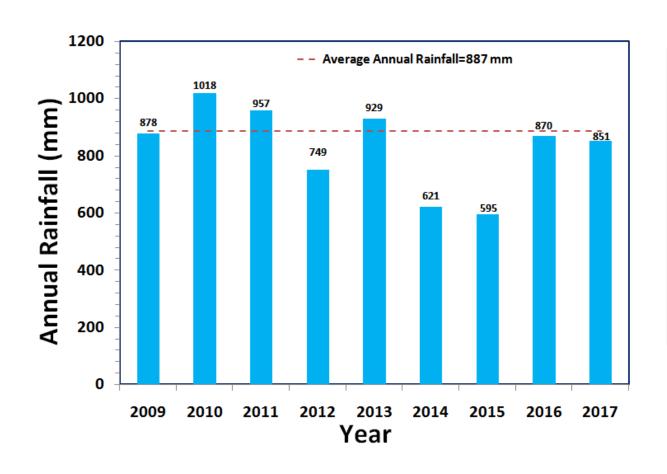

- The inventory and documentation of spatial and temporal changes in hydrological components of Yaragal sub-watershed (4D5B2H) in Yadgir Taluk, Yadgir District, has been undertaken for integrated planning, development and management.
- Yaragal sub-watershed (Yadgir Taluk, Yadgir District) is located between 16<sup>0</sup>53'14"-16<sup>0</sup>57'54" North latitudes and 77<sup>0</sup>1'48"-77<sup>0</sup>7'7" East longitudes, covering an area of about 5062.97 ha.
- This sub-watershed encompasses of 9 MWs namely Sankanur (4D5B2H1a), Yadgir Rf-1 (4D5B2H1d), Yadgir Rf-2 (4D5B2H1e), Yadgir Rf-3 (4D5B2H2a), Yadgir Rf-4 (4D5B2H2b), Yagapur Tanda-1 (4D5B2H1c), Yagapur Tanda-2 (4D5B2H1b), Yargol-1 (4D5B2H2c) and Yargol-2 (4D5B2H2d). Land Resource Inventory (LRI) was generated for all the nine micro-watersheds.
- Average annual rainfall (1960-2014) of the Hobli (Block) pertaining to the sub-watershed is 887 mm.
- In this sub-watershed major *kharif* crops grown are Maize, Cotton, Sunflower, Groundnut, Red gram, Chilly, Soybean, Paddy and major *rabi* crops are Sorghum, Bengalgram, Bajra.
- Hydrological components namely rainfall (annual, *kharif*, *rabi* and summer), PET, AET, runoff, surface soil moisture, ground water status and water balance are presented.

#### **LOCATION MAP OF YARAGAL SUB-WATERSHED**

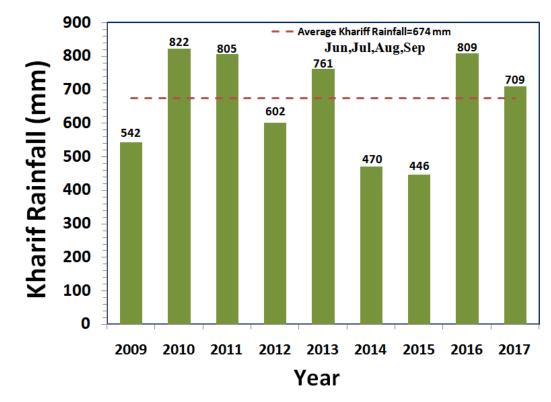

Soil & Water Conservation Structures in Yaragal subwatershed, Yadgir Taluk, Yadgir District

#### **RAINFALL INDEX**

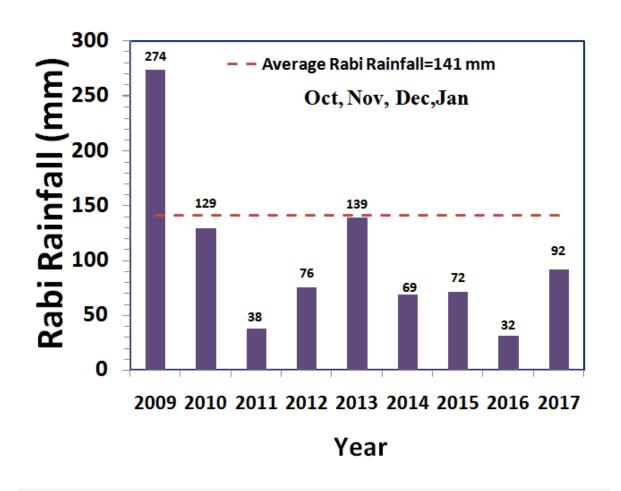

The average annual rainfall (1960-2014) recorded at the Yadgir station in Yadgir taluk of Yadgir district is 887 mm. The annual rainfall at Hattikuni station (Hobli H.Q.) is presented. During the years 2012, 2014, 2015, 2016 and 2017 the annual rainfall was deficient by 22%, 42%, 46%, 3 % and 6% respectively.

The *kharif* rainfall (Jun–Sep) is an average about 80% of the annual rainfall and it typically follows the annual rainfall patterns. During the years 2009, 2012, 2014 and 2015 the annual rainfall was deficient by 20%, 11%, 30% and 34% respectively.

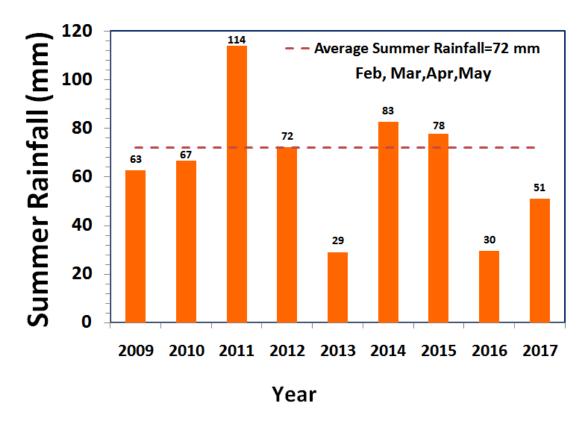

#### **RAINFALL INDEX**

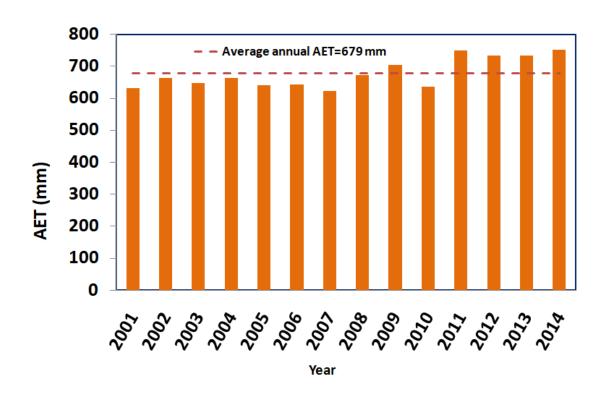

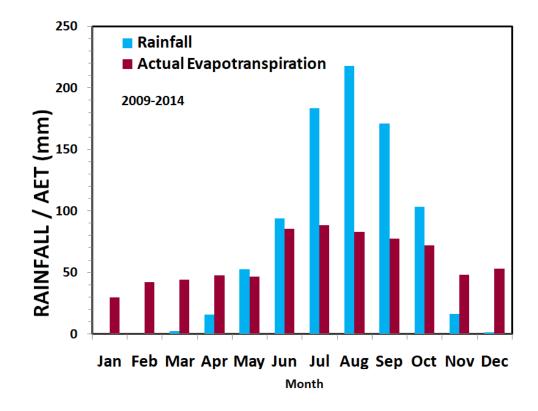

The average summer rainfall (Feb-May) is about 8% of the average annual rainfall.

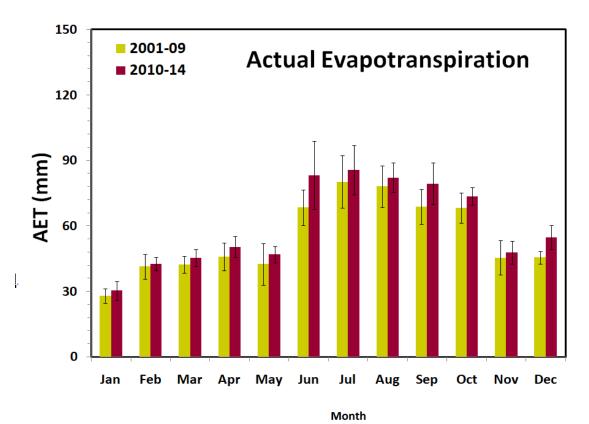

The average *rabi* rainfall (Oct-Jan) is about 12% of the Average annual rainfall. During the year 2009 high *rabi* rainfall was received, where as other years showed deficient rainfall.

#### **EVAPOTRANSPIRATION**

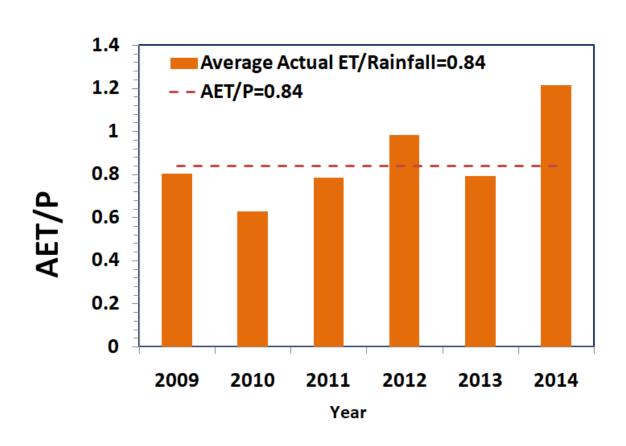

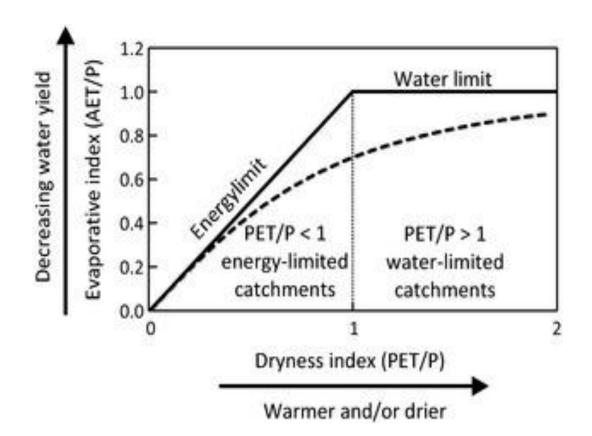

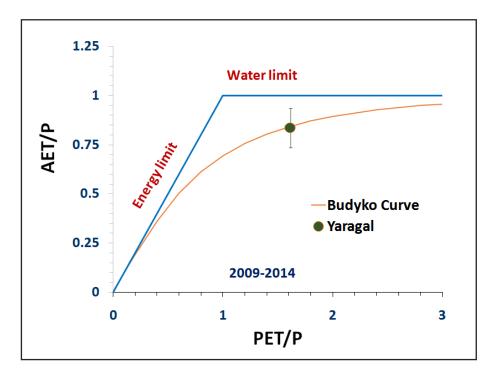

The average annual actual ET is lower than the average rainfall. During *kharif*, average rainfall and AET was found to be 674 mm and 335 mm respectively, whereas in *rabi* it was about 141 mm and 203 mm. The annual ET increased by 9% during 2010-2014 compared to 2001-2009.

#### **EVAPOTRANSPIRATION INDEX**

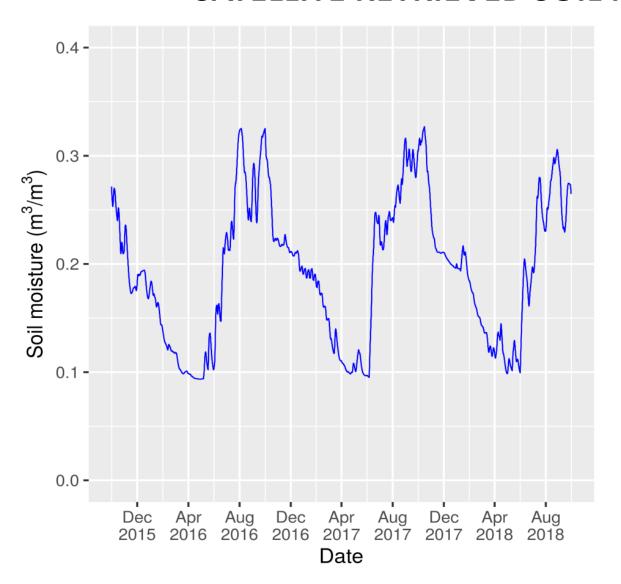

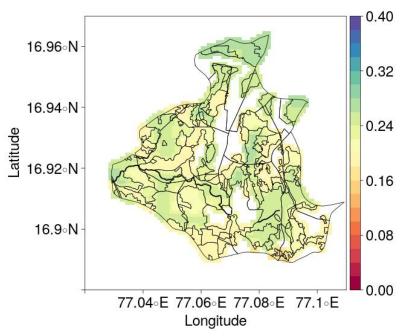

The average AET/P ratio was about 84%, which is slightly higher than the sustainable limit of about 80%. Even during extremely lower rainfall year of 2015, AET was 680 mm. This suggests the presence of water storage and utilization from other sources such as groundwater, which buffered the lower rainfall.

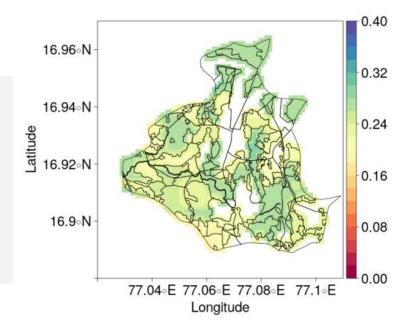

#### SATELLITE RETRIEVED SOIL MOISTURE

## Yaragal– Rabi Soil Moisture

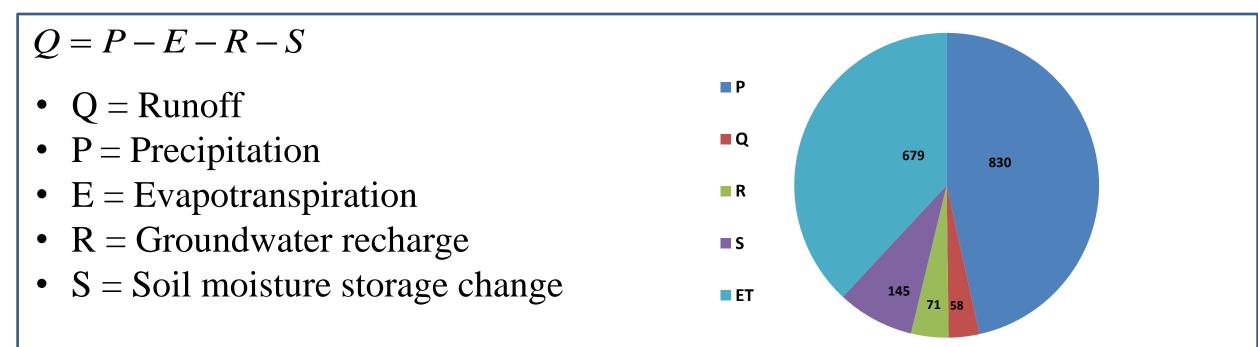

#### Yaragal-Kharif Soil Moisture

The method developed for retrieving soil moisture from multi-satellite observations allowed to map surface soil moisture behavior in the micro-watershed. The available surface moisture was varied in the range of 17-29 % in *kharif* and 18-33% in *rabi* seasons of 2016 and 9-31% in *Kharif* and 19-32% in *rabi* seasons of 2017.

#### **WATER BALANCE**

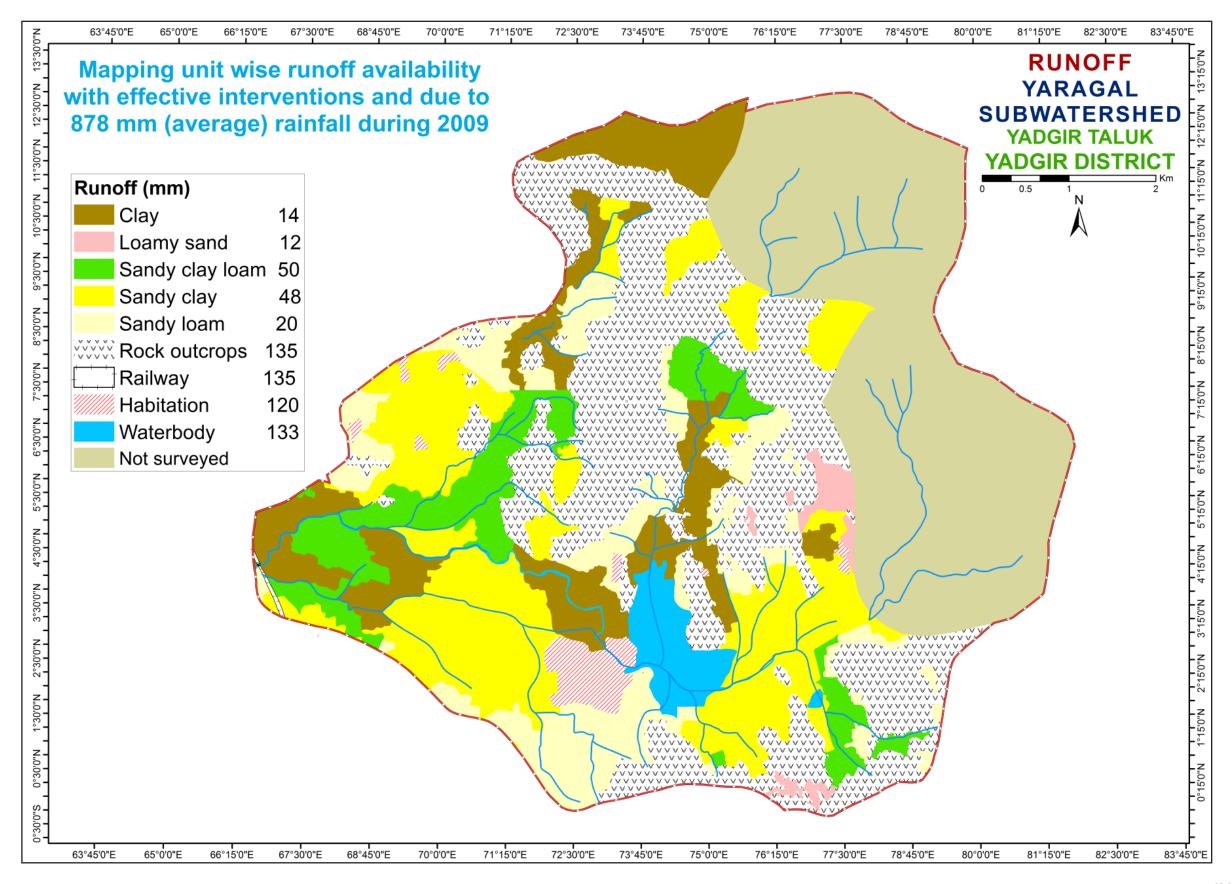

During July-October months, Precipitation is higher than Evapotranspiration, hence Runoff can occur in the watershed.

 $P = 830 \ mm$  (average of 2009-2017)  $ET = 679 \ mm$   $R = 71 \ mm$   $S = 145 \ mm$   $Q = 58 \ mm$ 

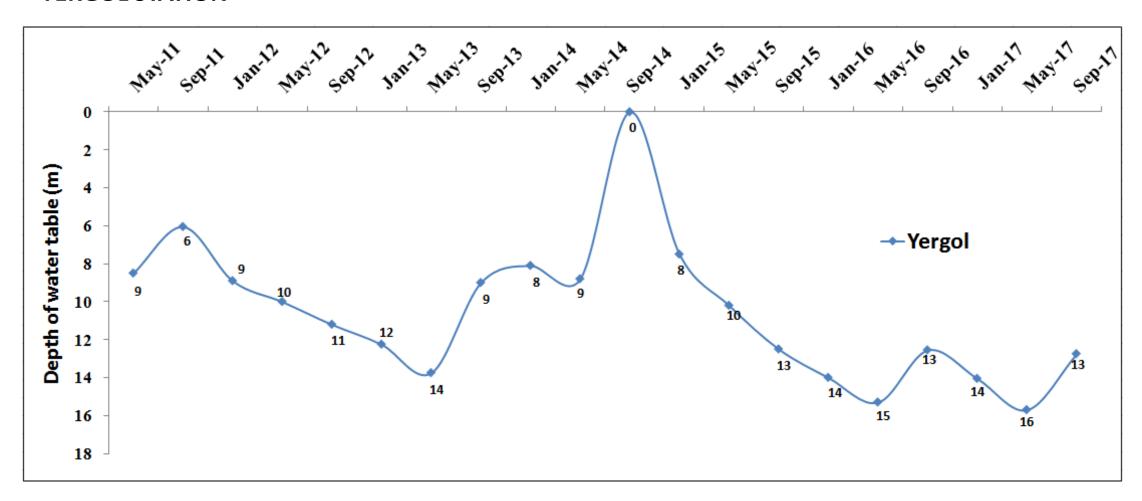

Sl. No.	Parameters	Average_ 2009 (mm)
1.	Rainfall	878
2.	Runoff availability with existing conditions	103
3.	Runoff availability with effective interventions	72
4.	Runoff allowed as environmental flow at the outlet	14
5.	Runoff excess for harvesting by construction of structures	58

#### **RUNOFF**

#### **GROUND WATER STATUS**

#### **YERGOL STATION**

The total number of wells present in Yaragal Sub-watershed as per LRI data is 16 Bore wells. The groundwater level shown above is from the data obtained from Dept. of Mines & Geology for the nearest station Yergol. The graph depicts the groundwater level during the years 2011-2017 were slightly varying, where as during the year 2014 was found constant.

#### **SUMMARY**

- The average annual rainfall of 887 mm in the Yaragal sub-watershed as recorded from the Hattikuni station data.
- ➤ 80%, 12% and 8% of the annual rainfall occurs during *kharif*, *rabi* and summer seasons respectively and exhibited a higher temporal variability.
- ➤ The evapotranspiration estimation tool developed indicates that the watershed water balance is in deficit. The cropping & irrigation choices are not appropriate and need to be altered to shift the deficit water balance.
- The estimated runoff available to use is 58 mm for an average annual rainfall of 830 mm (2009-2017). The utilizable groundwater is 49.7 mm (70% of 71 mm recharge estimated). This means the total available water resource combining the soil moisture store for kharif & rabi (145 mm) and utilizable runoff plus recharge is 253 (=145+58+50)
- ➤ The average actual evapotranspiration estimated in the watershed based on the current land use and irrigation practices for the kharif and rabi seasons is 538 mm. Hence the amount of water use for kharif and rabi seasons may be estimated as 672 mm (i.e. 125% of AET). This demand for the two seasons is higher by 419 mm, i.e. (672-253). The AET in June-Sept months is only 50% of rainfall. Hence, there is a good opportunity to harvest the excess water through watershed management practices for utilizing during rabi season.
- The total number of wells present in Yaragal Sub-watershed as per LRI data is 16 Bore wells. The groundwater level data obtained from Dept. of Mines & Geology for the nearest station Yergol. The groundwater level during the years 2011-2017 were slightly varying, where as during the year 2014 was found constant.
