OCTOBER

LIVESTOCK DISEASE RISK FOREWARNING REPORT

Powered by Artificial Intelligence

Prepared By: Dr. K. P. Suresh
                 Dr. D. Hemadri
                 Dr. S.S. Patil
                 Dr. P. Krishnamoorthy
                 Dr. S.J. Siju

Disclaimer

The forewarnings are based on the retrospective disease data available in the NADRES database. Hence, for those states wherein data is limited/less, the forewarning may not be realistic. Further the forewarning will not take into consideration the control measures that are *in situ*.

1. About the Bulletin…

Livestock sector plays a crucial role in the rural economy of India as around 20.5 million people depend upon livestock for their livelihood. Even though the investment in the livestock sector is meagre, tremendous achievements have been observed in the sector during the last decade. As it is an important component in poverty alleviation programmes, continuous emphasis is being laid on this sector for enhancing the quality of the primary and secondary products in the international market, which in turn demands improved animal health. Therefore, livestock development programmes cannot succeed unless a well-organized animal health service is built up and in place for safeguarding the livestock against economically important diseases.

India has made a noteworthy success in the eradication of Rinderpest (RP), CBPP, AHS and Dourine. However, there are several other infectious and non-infectious diseases prevailing in the country causing huge annual economic loss. Prevention, control and eradication of the animal diseases need a thorough understanding of the epidemiology as well their economic impact.

National Institute of Veterinary Epidemiology and Disease Informatics (NIVEDI) has the mandate to carry out research activities in the area of veterinary epidemiology and disease informatics. With the eradication of RP successfully, India has not only proved its ability to face the challenges but also to succeed, despite various limitations. Similar efforts are needed to control and eradicate diseases like FMD, PPR, Brucellosis, CSF, HS etc., which cause huge economic loss annually to the livestock industry. To this end, ICAR-NIVEDI has identified 13 priority diseases, based on the past incidence patterns and has built a strong database of these diseases. The database, which is the backbone of the National Animal Disease Referral Expert System (NADRES$_{v2}$), is used for providing monthly livestock disease forewarning, which is compiled in this monthly bulletin to alert the animal husbandry departments, both at the National/state level, to take appropriate control measures. We hope users/stakeholders find this bulletin useful in their quest to control livestock diseases. This forewarning bulletin will assist the field Veterinarians in adopting appropriate preventive and control measures, thereby reducing the occurrence of livestock disease outbreaks.

2. SUMMARY OF THE FOREWARNING BULLETIN....

The association between infectious diseases and the climate was known from ancient times. Hippocrates observed in the 5th century that epidemics were associated with natural phenomenon rather than divinities or demons. In modern times, our increasing capabilities to detect and predict climate variations joined with growing evidence for global climate change, have powered interest in understanding the impacts of climate on animal health, particularly the emergence and transmission of infectious disease agents. Simple reasoning suggests that climate can affect infectious disease patterns because disease agents (viruses, bacteria, and parasites) and their vectors are sensitive to temperature, moisture, and other ambient environmental conditions.

India being an agriculture-based country, the livestock sector plays a vital role in contributing to the economy. A robust reporting and forewarning system enable the concerned authorities in disease preparedness and awareness of the risk associated with livestock disease. Therefore, the economic loss due to morbidity and mortality of the animals is reduced thereby helps to increase the productivity in terms of egg, meat, and dairy products. National Animal Disease Referral Expert System database is a weather-based forewarning system enabled with an artificial intelligence system developed by ICAR- National Institute of Veterinary Epidemiology & Disease Informatics Bengaluru, Karnataka state, India that forecast potential threats from pathogens two months in advance to provide the stakeholders with sufficient timeline for awareness and preparedness to act. Artificial Intelligence (AI) and Machine learning (ML) models use the programmed algorithms that receive and analyse input data to predict output (Infectious risk prediction) values within an acceptable range. As new data fed into these algorithms, they learn and optimize their operations to improve performance, developing intelligence over time.

The livestock disease forecasting for October 2021 revealed Jharkhand (120), Uttar Pradesh (94), Karnataka (53), Assam (50) and Kerala (40) as the top five states with high predicted livestock disease outbreaks.

Among the predicted diseases, control programmes are in full swing for FMD and PPR in the country and due attention is demanded by the predicted disease outbreaks of these diseases. Among the expected disease outbreaks, the predicted FMD outbreaks are more in Karnataka (21) followed by Tamil Nadu (16) and Kerala (13) whereas predicted PPR outbreaks are more in Jharkhand (10). Further the co-occurrence of FMD and HS can be expected in Bihar, Jharkhand, Karnataka, Kerala, Madhya Pradesh, Manipur, Meghalaya, Odisha, Tripura and West Bengal. Among the different diseases in livestock, the predicted outbreaks are expected to be high for FMD (89) and theileriosis (70).

The major challenges for the effective disease control programme being the lack of thorough understanding about the complexity of disease dynamics, wide host range of pathogens, widening of niche of pathogens due to climate change etc. Further, India has witnessed emergence and re-emergence of various infectious pathogens during the last decade, of which most of the diseases are of zoonotic in nature which urge for the necessity of strengthening of monitoring and surveillance system in the country. Effective control programme for major livestock diseases in the country can be efficiently addressed by planning and execution of available control measures in the high-risk areas and routine surveillance and monitoring of diseases.

Table S1. Summary of State wise Livestock Disease forewarning for October 2021

Sl. No	State Name	Anthrax	Babesiosis	BQ	BT	ET	Fasciolosis	FMD	HS	PPR	S&G Pox	SF	Theileriosis	Trypanosomiasis	Total number of disease

3. INTRODUCTION TO NADRES v2

The geographic and seasonal distribution of many infectious diseases are associated with climate and therefore the possibility of using seasonal climate forecasts as predictive indicators in disease early warning system (EWS) became imminent. In this context, ICAR-NIVEDI, in its quest for achieving better livestock health, had developed an interactive web portal named "National Animal Disease Referral Expert System (NADRES)" during early part of the first decade of the millennium. The web portal which was developed from the financial support of National Agricultural Technology Project was launched in the year 2005. The portal which is interactive, allows the user/stakeholder to access livestock disease forewarning (n=13) at the district level for entire country two months in advance. The portal which was initially built on oracle platform was later changed to MySQL platform to store the administrator provided disease information and other relevant meteorological and risk factor information. However, with the availability of remote sensed satellite images and the advancement in information technology and statistical algorithms, the upgradation of NADRES became inevitable. To this end, a newer version of NADRES (NADRES *V2*) has been developed and is ready for release.

How it is different from previous version?

In brief, it can be said that NADRES $_{V2}$ underwent a sea change not only in its internal structure but also in its physical design. As a result, now the central menu bar consists of Home, About us, Risk factors, Analysis, Livestock disease, post prediction validation and contact details. Risk factors menu comprises of details on resolution, time interval, units and source of 11 meteorological and 5 remote sensing parameters. Analytics menu has various analysis options. The newly created livestock disease menu has the details regarding species affected, clinical signs and preventive measures to be adopted for the 13 economically important diseases. Post prediction validation menu contains the outbreak reports vs prediction. The menu bar on the RHS tabs include online GIS, state wise Livestock disease forecast, district wise Livestock disease forecast, Epi-calculator, download links for mobile app, etc. The website now hosts disease maps in the form of choropleth maps for 13 diseases in two time periods (1990-2000 and 2000-2018). Similarly, disease trends plots exhibit periodic regression plots providing future trend for the disease. On the LHS, Login menu is provided for authorized persons to login and enter disease details and other related parameters. Disease maps provide choropleth maps for 13 diseases in two time periods (1990-2000 and 2000-2018) is presented. Disease trends- Periodic regression plots are exhibited for prediction of the diseases. Auto-messaging option has been created to send the reminders in the form of text messages to concerned PI's and Co-PI's of AICRP centers for submission of outbreak reports. This message is sent weekly to all the concerned officials. Additionally, a message is sent to the concerned veterinary officers in Karnataka for initiation of preventive measures for the forewarned diseases at the block level. Plans are in place to incorporate farmers' and local vets' mobile numbers in to the list so that they may be asked to initiate preventive measures for the forewarned diseases.

Fig 3.1. NADRES V2 Home page

The forewarning methodology used is unique and has not been used earlier for livestock disease forewarning in India. Following few paragraphs describe about the forewarning methodology used. It is a well-known fact that weather plays an important role in the precipitation of many diseases and therefore, the climatic parameters such as land surface temperature (LST), precipitation, wind velocity, humidity etc are considered as risk parameters. These parameters along with other non-climatic parameters such as livestock population, density, Normalized Differential Vegetation Index (NDVI), soil moisture constitute the overall risk parameters. A total of 24 such parameters are collected/generated at village level and then aggregated to district level before these are used for analysis.

In addition to the output provided at interactive web portal, the NADRES output are also published in the form of monthly livestock disease forewarning bulletins. The prediction results come with a disclaimer that forewarnings do not take into account of the control measures that already in situ and also may not be realistic for those regions where the data is either unavailable or limited. This bulletin provides the likely occurrence of the 13 shortlisted diseases two months in advance at the district level, disease forewarning maps, prediction accuracy, details on diseases, species affected, clinical signs and its preventive measures.

In summary, it can be said that NADRES $_{V2}$ has underwent substantial changes not only in its internal structure but also in its physical design and can be a useful tool for visitors of the website, farmers, vets, policy makers etc.

4. Forewarning Methodology

I.**Materials**

Livestock disease data

Previous 10 years′ livestock disease outbreak data retrieved from the NADRES database linked with Risk factors data.

Livestock population data

The population data at village level for five major livestock species viz., cattle, buffalo, sheep, goat and pigs were obtained from 20th Livestock census (2019) fromDepartment of statistics, DAHD, GOI.

Species-wise & Category-wise Livestock Population (in thousands)					
Sl No	Species	Category	Population in 2012	Population in 2019	% Change
1	Cattle	Exotic	39732	51356	29.3
		Indigenous	151172	142106	-6
		Total	190904	193462	1.3
2	Buffalo	Total	108702	109852	1.1
3	Sheep	Exotic	3781	4088	8.1
		Indigenous	61288	70172	14.5
		Total	65069	74260	14.1
4	Goat	Total	135173	148885	10.1
5	Pig	Exotic	2456	1897	-22.8
		Indigenous	7837	7159	-8.7
		Total	10293	9056	-12
6	Yaks	Total	77	58	-24.7
7	Mithuns	Total	298	386	29.5
8	Horses & Ponies	Total	625	342	-45.3
9	Mules	Total	196	84	-57.1
10	Donkeys	Total	319	124	-61.1
11	Camels	Total	400	252	-37
Total Livestock			**512056**	**536761**	**4.8**

Meteorological and Remotely sensed data:

The parameters such as air temperature (^{0}C), perceptible water (mm), pressure (millibar), relative humidity (%) and sea level pressure (millibar) were extracted from National Centre for environmental prediction (NCEP). The parameters such as potential evapotranspiration (PET), Enhanced Vegetation Index (EVI), Leaf Area Index (LAI), Land Surface Temperature (LST), Normalised Difference Vegetation Index (NDVI) were extracted from remote sensed images from MODIS website (https://modis.gsfc.nasa.gov/). In brief, the MODIS products from NASA-TERRA satellite was downloaded for the Indian locations by specifying the tiles (H24V5, H25V6, H24V6, H24V7, H25V7, H25V8, H26V7, H26V6) from 2001 to till date.

The details are given below;

PRODUCT	Science Data Sets (HDF Layers)
MOD15A2H	Lai_500m(Leaf area index) 8 days average
MOD16A2	PET_500m (Total Potential Evapotranspiration) 8 days average
MOD11A2	LST_Day_1km (Daytime Land Surface Temperature) 8 days average
MOD13A1	i. 500m 16 days NDVI (Normalized Difference Vegetation Index) ii. Enhanced Vegetation Index (EVI) 16 days average

The downloaded HDF files (Datasets, which are multidimensional arrays (layers) of a homogeneous type) were converted to GeoTIFF files (single layer data) using R packages, which were later used to extract the parameters by linking it with the sinusoidal values of the Indian villages. The scale factors were multiplied for the extracted values as specified by the MODIS data products to get the values of the parameters. As shown above, the atmospherically corrected NDVI was collected on 16‑day interval at 250‑meter resolution using MODIS product MOD13A1 and LST was collected on 8‑day interval using MOD11A2 at 1 KM resolution.

The parameters such as rainfall, soil moisture and wind speed were obtained from Global Land Data Assimilation System of NASA (https://disc.gsfc.nasa.gov). The remaining parameters were downloaded from climatic research unit (CRU) of University of East Anglia website. It is worth mentioning that the entire process of extraction, assimilation, processing and aligning have been done using R programming language and R environment. After aligning the climatic and non‑climatic data with the disease and the livestock population data (aggregated at the district level), the statistical analysis was performed in the R environment.

Initially, two regression models and six machine learning models were applied to test their suitability to fit the data and in all, three models; one regression model (Generalized Linear Model (GLM) and two machine learning models, *viz.*, Gradient Boosting Machine Learning Algorithm (GBM) and Random Forest (RF), which fitted to data well were incorporated for the purpose of disease prediction. The models were trained using the case and control data available at ICAR‑NIVEDI. Validation of the models were done by dividing the total observations for a particular disease into marker samples and validation samples and accuracy was tested in terms of discrimination power, which was done using Receiving Operating Characteristics (ROC), Cohen Kappa (Heildke Skill Score) and True Skill statistics (TSS). Once the models produce the probability value, it was used for categorizing the risk. Briefly, when all the models produce the p value of more than 0.5, then the highest p value is used for determining the high‑riskcategory. If all the models or any one model produces the p value of less than 0.5, then the lowest p value was used for categorizing lower risk. This was done to minimize the false alert. Thus the risk predictions based on the probability values ranging from 0‑1 are made as follows; Very High Risk (p=0.81‑1.0), High Risk (p=0.61‑0.80), Moderate Risk (p=0.41‑0.60), Low Risk (p=0.21‑0.40), Very Low Risk (p=0.0‑0.20) and No Risk (p=0.0) for the occurrence of a said disease. It is believed that categorizing districts in to various risk categories will help the stake holders to effectively utilize the available resources (money and manpower).

II. NADRES v2 Data Flow and Data Processing Diagram

A) Data Flow Diagram:

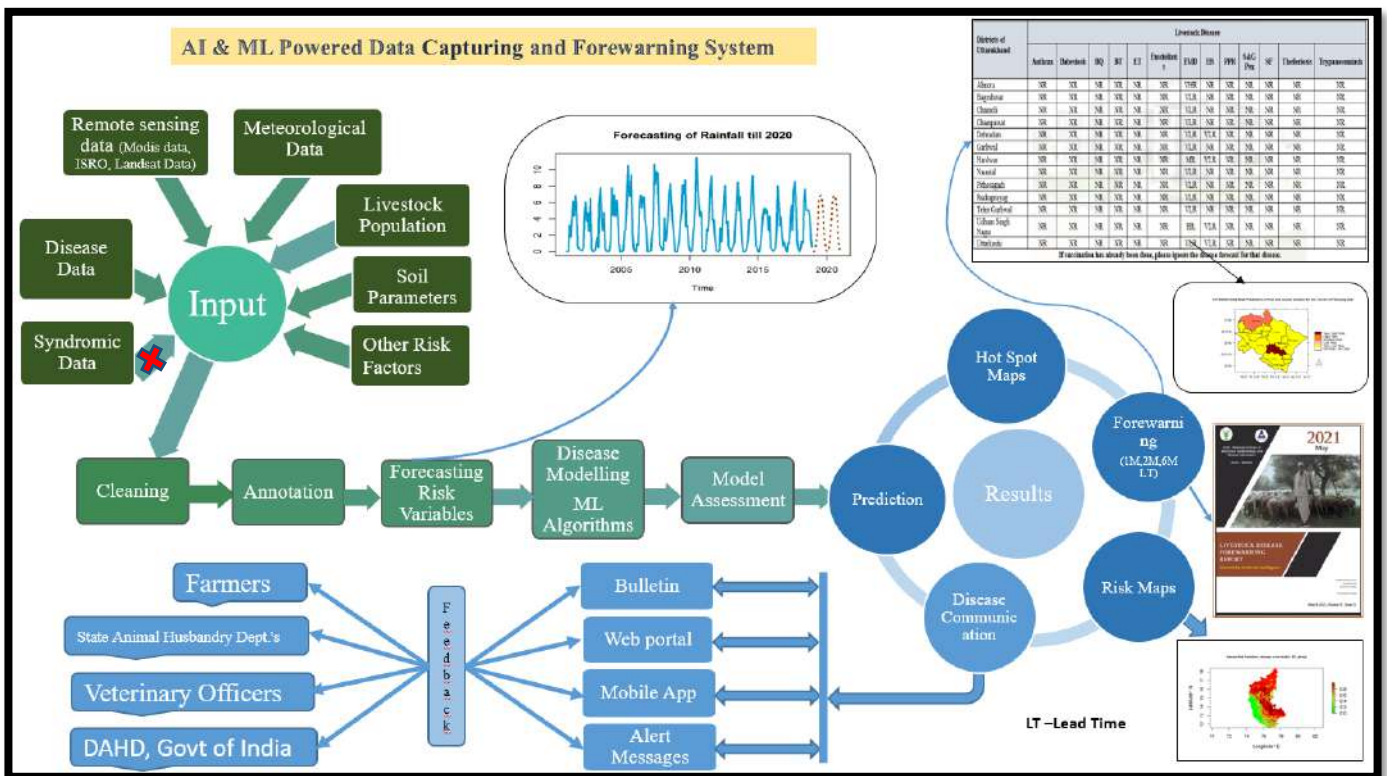

Fig 4.2). Data Capturing and Forewarning system

III. <u>Weighted outbreak score</u>

The outbreak data for the month of forecasting is extracted from NADRES database for the period of 10 years from current year. Outbreak data of 13 important livestock diseases are considered. The data is aggregated at district level and the weighted score is defined based on the number of outbreaks for each district in each month considering last 10 years. The weightage score was assigned as 0 for less than three number of outbreaks in the last 10 years for selected month, score 1 for 3−6 number of outbreaks and 2 for more than 6 outbreaks. This weightage score for each district is labelled as risk variable in building the models and risk maps.
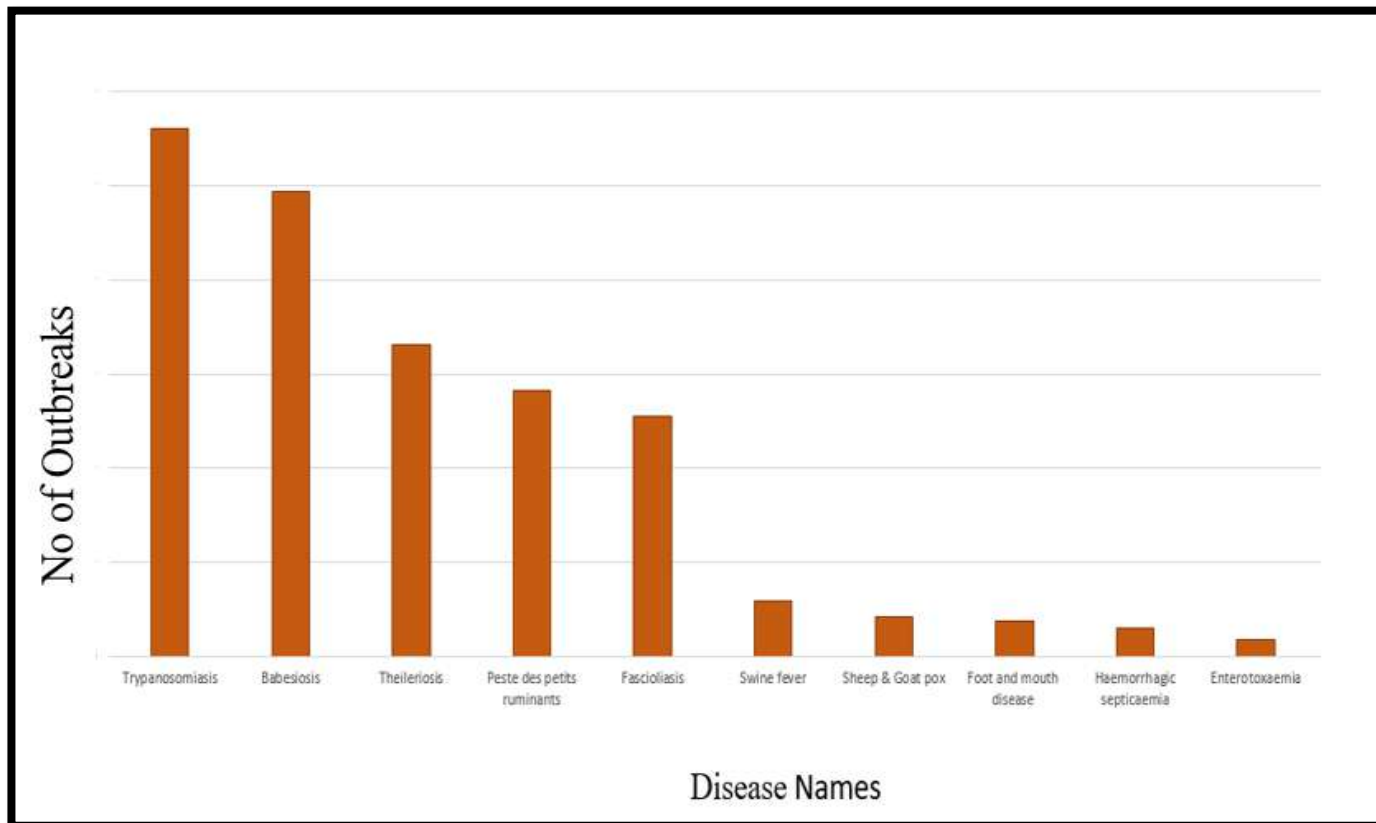

Fig 4.3. 2020 Top Ten diseases

IV. <u>Forecasting of weather parameters</u>

Weather forecasting has been one of the most challenging problems around the world because of both its practical value in meteorology and popular sphere for scientific research. Weather forecast systems are among the most complex equation systems that computer has to solve. A great quantity of data, coming from satellites, ground stations and sensors located around our planet send daily information that must be used to foresee the weather situation in next hours and days all around. Weather forecasts provide critical information about future weather. There are various techniques involved in weather forecasting, from relatively simple observation of the sky to highly complex computerized mathematical models. Further, forecast products by Indian Metrological department were used for validationof our forecasts (https://mausam.imd.gov.in/imd_latest/contents/extendedrangeforecast.php).

Following are the basic steps of forecasting process:

1. Determine the forecast's purpose
2. Establish a time horizon
3. Select a forecasting technique
4. Gather and analyse data
5. Perform the forecast
6. Monitor the forecast and use it in prediction of disease

Statistical Models used for forecasting of weather and remotely sensed variables

ARIMA stands for Autoregressive Integrated Moving Average. ARIMA is also known as Box-Jenkins approach. Box and Jenkins claimed that non-stationary data can be made stationary by differencing the series, Y_t. The general model for Y_t is written as,

$$Y_t = \phi_1 Y_{t-1} + \phi_2 Y_{t-2} ... \phi_p Y_{t-p} + \epsilon_t + \theta_1 \epsilon_{t-1} + \theta_2 \epsilon_{t-2} + ... \theta_q \epsilon_{t-q}$$

Where, Y_t is the differenced time series value, ϕ and θ are unknown parameters and ϵ are independent identically distributed error terms with zero mean. Here, Y_t is expressed in terms of its past values and the current and past values of error terms.

The ARIMA Model combines three basic Methods:

- Auto Regression (AR) − In auto-regression the values of a given time series data are regressed on their own lagged values, which is indicated by the "p" value in the model.
- Differencing (I-for Integrated) − This involves differencing the time series data to remove the trend and convert a non-stationary time series to a stationary one. This is indicated by the "d" value in the model. If d = 1, it looks at the difference between two-time series entries, if d = 2 it looks at the differences of the differences obtained at d =1, and so forth.
- Moving Average (MA) − The moving average nature of the model is represented by the "q" value which is the number of lagged values of the error term.

This model is called Autoregressive Integrated Moving Average or ARIMA(p, d,q) of Y_t. We will follow the steps enumerated below to build our model. ARIMA models were run in 18 combinations of p, d, q. Based on the minimum AIC value, the order of ARIMA model was selected. This order was used for the prediction of all the weather parameters used in developing disease forewarning models.

V. Implementation of Principal Component Analysis

Large datasets are gradually common and are often difficult to interpret. Principal Component Analysis (PCA) is a technique for reducing the dimensionality of such datasets, increasing the interpretability but at the same time, minimizing the information loss. The PCA is employed in NADRES v2 by creating new uncorrelated variables that successively maximize the variance. This means that ` preserving as much variability as possible` translates into finding new variables that are linear functions of those in the original dataset, that successively maximize variance and that are uncorrelated with each other. Determining such new variables, the principal components (PCs) reduces to solve an eigenvalue/eigenvector problem. PCA can be based on either covariance matrix or the correlation matrix and the main use of PCA are descriptive.

In the present study, all the meteorological and remote sensing variables are considering for PCA, with correlation matrix, the final output of principal components which are independent of each were considered for further ML modelling and risk estimation.

VI. Machine Learning Models

Disease outbreak data were aligned with generated risk variables to the respective latitude and longitude, which were subjected to climate-disease modelling. A number of models were fit to aligned data and tested for accuracy in terms of discrimination power. Two regression models, Generalized Linear Models (GLM) and Generalized Additive Models (GAM) and six machine learning algorithms, i.e. Random Forest (RF), Boosted Regression Tree (BRT), Artificial Neural Network (ANN), Multiple Adaptive Regression Spline (MARS), Flexible Discriminant Analysis (FDA) and Classification Tree Analysis (CTA) were employed for disease modelling. Different modelling methods return different types of ′model object′ and all these model objects could be used for the predict function to make predictions for any combinations of values of independent variables. Response plots were created to explore and understand model predictions.

The fitted models were assessed for their discriminating power using Receiving Operating Characteristic (ROC) curve, Cohen′s Kappa (Heildke Skill Score) and True Skill Statistics (TSS). These measures were used to evaluate the quality of predictions based on presence-absence data. Raster Stack was used to combine the results of individual predictions by different model methods. All the models were assessed for overfitting.

The outcome of best fitted models was in probability of disease occurrence and was categorised into 6 risk levels as No risk (NR), Very low risk (VLR), Low risk (LR), Moderate risk (MR), High risk (HR) and Very high risk (VHR) for enabling the stakeholders to take appropriate control measures by suitably allocating available resources.

5. Accuracy of Prediction

Serial No.	Diseases	Accuracy (%)
1.	Anthrax	99.69
2.	Babesiosis	97.38
3.	Black Quarter	99.85
4.	Blue Tongue	98.92
5.	Enterotoxaemia	99.85
6.	Fasciolosis	99.69
7.	Foot and mouth disease	93.67
8.	Haemorrhagic septicaemia	97.22
9.	Peste des Petits Ruminants	96.91
10.	Sheep & Goat pox	99.38
11.	Swine fever	99.69
12.	Theileriosis	97.84
13.	Trypanosomiasis	96.60

Aggregation and prediction of livestock diseases at district level leading to higher accuracy.

- **Formula Used:** The **Accuracy** of disease prediction was calculated using the following formula.

$$\frac{TP + TN}{Total} * 100$$

TP‑True Positive Observations, TN‑True Negative Observations, Total‑ Total observations.

- Internal Accuracy was performed using 10 years of data. Accuracy obtained was >90% for all the diseases predicted.

- Despite the power of climate and disease risk models, considerable uncertainties remain, identifying these uncertainties, highlighting importance of improved data may improve the model accuracy, realism, confidence, together with translating uncertainties in model inputs into uncertainties in model outputs, are important benefits of modelling.

6. Moran′s I for clustering of Livestock diseases

Moran's I is a tool that measures spatial autocorrelation (feature similarity) based on both feature locations and feature values simultaneously. Given a set of features and an associated attribute, it evaluates whether the pattern expressed is clustered, dispersed, or random. The tool calculates the Moran's I Index value and both a Z score and p-value evaluating the significance of that index. In general, a Moran's Index value near +1.0 indicates clustering while an index value near -1.0 indicates dispersion.

Autocorrelation tool, the null hypothesis states that "there is no spatial clustering of the values associated with the geographic features in the study area ."When the p-value is small and the absolute value of the Z score is large enough that it falls outside of the desired confidence level, the null hypothesis can be rejected .If the index value is greater than 0, the set of features exhibits a clustered pattern .If the value is less than 0, the set of features exhibits a dispersed pattern.

7. R Software

R is a programming language and software environment for statistical analysis, graphics representation and reporting. R is a simple and effective programming language which includes conditionals, loops, user defined recursive functions and input and output facilities. R statistical software version 3.1.3 (version 3.4.3, R Foundation for Statistical Computing, Vienna, Austria. https://www.R-project.org/) was used as an integrated suite for data mining, calculation and graphical display. Several R packages like *openxlx, raster, RMySQL, rgdal, RColorBrewer, sqldf, sp, spdep, xlsx, plyr, randomFores, dismo, SDMTool, dplyr, tmap and data table*were used for data extraction, data alignment, annotation, analysis, modelling and   risk   mapping.

8. Forewarning of livestock disease for the month of October 2021

i). District wise Livestock Disease forewarning:

District wise Livestock Disease Risk Forewarning for October 2021: Andaman and Nicobar

Districts of Andaman and Nicobar	Livestock Diseases												
	Anthrax	Babesiosis	BQ	BT	ET	Fasciolosis	FMD	HS	PPR	S&G Pox	SF	Theileriosis	Trypanosomiasis
Nicobars	NR	NR	NR	VLR	NR	*VHR*	LR	VLR	*HR*	NR	NR	NR	NR
North & Middle Andaman	NR	NR	NR	VLR	NR	*VHR*	NR	NR	NR	NR	NR	NR	NR
South Andaman	NR	NR	NR	VLR	NR	*VHR*	MR	VLR	NR	NR	NR	NR	NR

If vaccination is already been done, please ignore the disease forecast for that disease.

II) Glimpse about the risk of predicted diseases:

The Livestock disease risk obtained based on the Machine Learningalgorithm were further categorized into risk events using High Risk and Very High Risk.

1. Andaman and Nicobar

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Nicobars, North & Middle Andaman and South Andaman	Three	Fasciolosis
2.	Nicobars	One	Peste des Petits Ruminants

2. Andhra Pradesh

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Anantapur, Chittoor, Kurnool and Y.S.R.	Four	Anthrax
2.	Kurnool	One	Black Quarter
3.	Guntur, Krishna and Y.S.R.	Three	Haemorrhagic Septicaemia
4.	Krishna	One	Peste des Petits Ruminants
5.	Krishna and Prakasam	Two	Sheep & Goat pox

3. Arunachal Pradesh

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	East Kameng, East Siang, Lower Subansiri, Papum Pare and Upper Subansiri	Five	Fasciolosis

4. Assam

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Tinsukia	One	Babesiosis
2.	Baksa, Bongaigaon, Dhemaji, Goalpara, Golaghat, Jorhat and Karimganj	Seven	Black Quarter
3.	Kamrup, Kamrup Metropolitan, Nalbari and Sivasagar	Four	Enterotoxaemia
4.	Baksa, Bongaigaon, Darrang, Dhemaji, Dhubri, Dibrugarh, Goalpara, Golaghat, Jorhat, Kamrup, Kamrup Metropolitan, Lakhimpur, Morigaon, Sivasagar and Sonitpur	Fifteen	Fasciolosis
5.	Golaghat, Kamrup and Sivasagar	Three	Haemorrhagic Septicaemia
6.	Darrang, Golaghat, Karimganj, Nalbari and Sonitpur	Five	Peste des Petits Ruminants
7.	Karbi Anglong, Lakhimpur and Sonitpur	Three	Sheep & Goat pox
8.	Dhemaji, Dibrugarh, Golaghat, Karbi Anglong, Karimganj, Sivasagar, Sonitpur and Udalguri	Eight	Swine Fever
9.	Kamrup, Kamrup Metropolitan, Tinsukia and Udalguri	Four	Theileriosis

5. Bihar

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Arwal, Begusarai, Patna and Saran	Four	Foot and Mouth Disease
2.	Aurangabad	One	Haemorrhagic Septicaemia
3.	Aurangabad	One	Peste des Petits Ruminants
4.	Patna	One	Swine Fever

6. Goa

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	North Goa	One	Babesiosis
2.	North Goa	One	Foot and Mouth Disease

7. Gujarat

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Sabar Kantha	One	Enterotoxaemia
2.	Kheda	One	Fasciolosis
3.	Panch Mahals	One	Haemorrhagic Septicaemia
4.	Amreli, Bhavnagar and Vadodara	Three	Peste des Petits Ruminants
5.	Junagadh and Surat	Two	Trypanosomiasis

8. Haryana

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Sirsa	One	Babesiosis
2.	Bhiwani	One	Haemorrhagic Septicaemia
3.	Hisar and Sonipat	Two	Peste des Petits Ruminants
4.	Bhiwani	One	Swine Fever
5.	Hisar	One	Theileriosis

9. Himachal Pradesh

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Chamba	One	Peste des Petits Ruminants

10. Jammu & Kashmir

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Badgam	One	Foot and Mouth Disease
2.	Baramula	One	Peste des Petits Ruminants
3.	Badgam, Bandipore, Pulwama, Shupiyan and Srinagar	Five	Sheep & Goat pox

11. Jharkhand

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Deoghar	One	Anthrax
2.	Except one district (Koderma) remaining all twenty-three districts.	Twenty-three	Babesiosis
3.	Deoghar and Sahibganj	Two	Black Quarter
4.	Bokaro, Giridih and Sahibganj	Three	Enterotoxaemia
5.	Except two districts (Dumka and Ramgarh) remaining all twenty-two districts.	Twenty-two	Fasciolosis
6.	Bokaro, Deoghar, Dumka, Jamtara, Khunti, Pashchimi Singhbhum, Purbi Singhbhum and Simdega	Eight	Foot and Mouth Disease
7.	Khunti and Sahibganj	Two	Haemorrhagic Septicaemia
8.	Bokaro, Deoghar, Dhanbad, Dumka, Gumla, Khunti, Lohardaga, Palamu, Ranchi and Sahibganj	Ten	Peste des Petits Ruminants
9.	Khunti and Sahibganj	Two	Sheep & Goat pox

10.	Deoghar, Giridih and Sahibganj	Three	Swine Fever
11.	Except one district (Koderma and Latehar) remaining all twenty-two districts.	Twenty-two	Theileriosis
12.	Except one district (Koderma and Seraikela - Kharsawan) remaining all twenty-two districts.	Twenty-two	Trypanosomiasis

12. Karnataka

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Bellary, Chamarajanagar, Chikkaballapura, Chitradurga, Davanagere, Koppal, Raichu and Tumkur	Eight	Anthrax
2.	Hassan, Mysore and Ramanagar	Three	Black Quarter
3.	Chikkaballapura, Koppal, Shimoga and Tumkur	Four	Enterotoxaemia
4.	Bangalore Ruler, Bangalore Urban, Bellary, Chikmagalur, Chitradurga, Dakshina Kannada, Davanagere, Dharwad, Hassan, Haveri, Kodagu, Kolar, Mandya, Mysore, Raichur, Ramanagara, Shimoga, Tumkur, Udupi, Uttara Kannada and Yadgir	Twenty- one	Foot and Mouth Disease
5.	Chitradurga and Tumkur	Two	Haemorrhagic Septicaemia
6.	Dharwad, Gadag and Tumkur	Three	Peste des Petits Ruminants
7.	Bangalore Urban, Bellary, Chikkaballapura, Chitradurga, Davanagere, Haveri and Tumkur	Seven	Sheep & Goat pox
8.	Bangalore Ruler, Bangalore Urban, Chikkaballapura and Mandya	Four	Theileriosis
9.	Gulbarga	One	Trypanosomiasis

13. Kerala

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Thiruvananthapuram and Thrissur	Two	Anthrax
2.	Ernakulam	One	Babesiosis
3.	Alappuzha, Ernakulam, Idukki, Kannur, Kasaragod, Kollam, Kottayam, Kozhikode, Malappuram, Palakkad, Pathanamthitta, Thrissur and Wayanad	Thirteen	Foot and Mouth Disease
4.	Ernakulam, Idukki, Kottayam, Pathanamthitta and Thrissur	Five	Haemorrhagic Septicaemia
5.	Alappuzha, Kannur, Kozhikode, Malappuram and Thiruvananthapuram	Five	Peste des Petits Ruminants
6.	Ernakulam, Idukki, Kannur and Palakkad	Four	Swine Fever
7.	Ernakulam, Idukki, Kannur, Kollam, Kottayam, Kozhikode, Palakkad, Pathanamthitta, Thiruvananthapuram and Wayanad	Ten	Theileriosis

14. Madhya Pradesh

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Betul	One	Anthrax
1.	Chhindwara and Rewa	Two	Black Quarter
2.	Betul, Chhindwara and Hoshangabad	Three	Foot and Mouth Disease
3.	Betul, Chhindwara, Indore, Jabalpur, Jhabua and Rajgarh	Six	Haemorrhagic Septicaemia
4.	Betul	One	Peste desPetitsRuminants
5.	Jabalpur	One	Swine Fever

15. Maharashtra

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Ahmadnagarand Dhule	Two	Black Quarter
2.	Nashik	One	Enterotoxaemia
3.	Ahmadnagar, Aurangabad, Dhule, Nashik and Thane	Five	Haemorrhagic Septicaemia
4.	Ahmadnagar, Aurangabad and Nagpur	Three	Peste desPetitsRuminants
5.	Nashik	One	Theileriosis

16. Manipur

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Thoubal	One	Babesiosis
2.	Chandel, Churachandpur, Imphal East and Thoubal	Four	Black Quarter
3.	Bishnupur, Imphal West, Imphal East, Senapati andThoubal	Five	FasciolosisFasciolosis
4.	Imphal West and Imphal East	Two	Foot and Mouth Disease
5.	Ukhrul	One	Haemorrhagic Septicaemia
6.	Senapati	One	Sheep & Goat pox
7.	Chandel, Imphal East, Tamenglong and Thoubal	Four	Swine Fever

17. Meghalaya

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	North Garo Hills	One	Babesiosis
2.	East Jaintia Hills, East Khasi Hills,Southwest Garo Hills,	Five	Black Quarter

	West Garo Hills and West Khasi Hills		
3.	East Khasi Hills, Jaintia Hills, Ribhoi, West Garo Hills and West Khasi Hills	Five	Foot and Mouth Disease
4.	West Garo Hills	One	Haemorrhagic Septicaemia
5.	East Khasi Hills, Southwest Garo Hills and West Garo Hills	Three	Swine Fever

18. Nagaland

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Dimapur and Kohima	Two	Foot and Mouth Disease
2.	Dimapur, Kohima, Longleng, and Zunheboto	Four	Swine fever

19. Odisha

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Koraput	One	Anthrax
2.	Anugul, Kendrapara, Nuapada and Rayagada	Four	Black Quarter
3.	Cuttack, Kendrapara and Rayagada	Three	Enterotoxaemia
4.	Khordha and Nuapada	Two	Foot and Mouth Disease
5.	Jagatsinghapur	One	Haemorrhagic Septicaemia
6.	Kendrapara	One	Peste des Petits Ruminants
7.	Subarnapur	One	Sheep & Goat pox
8.	Mayurbhanj	One	Theileriosis

20. Puducherry

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Karaikaland Puducherry	Two	Babesiosis
2.	Yanam	One	FasciolosisFasciolosis
3.	Puducherry	One	Sheep & Goat pox
4.	Puducherry	One	Theileriosis

21. Rajasthan

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Jodhpur	One	Enterotoxaemia
2.	Ajmer,Dhaulpur, Sirohi and Tonka	Four	Haemorrhagic Septicaemia
3.	Jaipur, Pali and Tonk	Three	Peste desPetitsRuminants
4.	Jhunjhunun	One	Sheep & Goat pox
4.	Bikaner, Jodhpur, Kota and Udaipur	Four	Trypanosomiasis

22. Tamil Nadu

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Dharmapuri, Dindigul, Kancheepuram, Krishnagiri, Madurai, Ramanathapuram, Thiruvallur, Vellore, Viluppuram and Virudhunagar	Ten	Anthrax
2.	Kancheepuram, Tiruvannamalai and Viluppuram	Three	Black Quarter
3.	Viluppuram	One	Enterotoxaemia
4.	Coimbatore, Cuddalore, Dharmapuri, Dindigul, Erode, Kancheepuram, Krishnagiri, Nagapattinam, Namakkal,	Sixteen	Foot and Mouth Disease

	Salem, Thanjavur, Theni, Thiruvallur, Tiruvannamalai, Vellore and Viluppuram		
5.	Salem, Sivaganga and Thanjavur	Three	Peste desPetitsRuminants
6.	Dharmapuri	One	Sheep & Goat pox

23. Telangana

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Warangal	One	Enterotoxaemia
2.	Mahbubnagar	One	Peste desPetitsRuminants

24. Tripura

Sl. No	Disease prone districts	Number of disease prone for districts	Disease Name
1.	West Tripura	One	Anthrax
2.	South Tripura and West Tripura	Two	Babesiosis
3.	North Tripura and South Tripura	Two	Black Quarter
4.	Dhalai and West Tripura	Two	Fasciolosis
5.	North Tripura, South Tripura and West Tripura	Three	Foot and Mouth Disease
6.	North Tripura, South Tripura and West Tripura	Three	Haemorrhagic Septicaemia
7.	Dhalai and South Tripura	Two	Peste des Petits Ruminants
8.	Dhalai ,North Tripura and South Tripura	Three	Sheep & Goat pox
9.	Dhalai, South Tripura and West Tripura	Three	Swine Fever

25. Uttar Pradesh

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Allahabad, Baghpat, Ballia, Banda, Bara Banki, Bijnor, Budaun, Bulandshahr, Chitrakoot, Etah, Fatehpur, Gorakhpur, Hardoi, Kannauj, Kanpur Nagar, Kheri, Kushinagar, Mathura, Meerut, Mirzapur, Saharanpur, Sitapur, Sonbhadra and Varanasi	Twenty-four	Babesiosis
2.	Ambedkar Nagar, Jaunpur, Meerut, Sant Ravidas Nagar (Bhadohi) and Sonbhadra	Five	Fasciolosis
3.	Sonbhadra	One	Haemorrhagic Septicaemia
4.	Fatehpur	One	Swine Fever
5.	Bareilly, Etah, Fatehpur, Gonda, Gorakhpur, Hardoi, Kanpur Nagar, Moradabad and Sonbhadra	Nine	Peste des Petits Ruminants
6.	Gonda	One	Sheep & Goat pox
7.	Allahabad, Azamgarh, Ballia, Bara Banki, Budaun, Bulandshahr, Fatehpur, Gorakhpur, Hardoi, Jalaun, Kanpur Nagar, Kushinagar, Mahrajganj, Mathura, Mirzapur, Rae Bareli, Saharanpur and Sitapur	Eighteen	Theileriosis
8.	Aligarh, Allahabad, Ambedkar Nagar, Baghpat, Bahraich, Ballia, Banda, Bara Banki, Bijnor, Bulandshahr, Chandauli, Chitrakoot, Etah, Fatehpur, Gonda, Gorakhpur, Hardoi, Jalaun, Jaunpur, Kannauj, Kanpur Nagar, Kheri, Kushinagar, Lucknow, Mainpuri, Mathura, Meerut, Mirzapur, Pratapgarh, Rae Bareli, Saharanpur, Sitapur, Sonbhadra, Sultanpur and Unnao.	Thirty-six	Trypanosomosis

26. Uttarakhand

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Hardwar	One	Haemorrhagic Septicaemia
2.	Almora	One	Peste des Petits Ruminants

26. West Bengal

Sl. No	Disease prone districts	Number of districts prone for disease	Disease Name
1.	Bankura, Hugli, Murshidabad and Nadia	Four	Anthrax
2.	Birbhum, Dakshin Dinajpur and Nadia	Three	Babesiosis
3.	Bankura, Dakshin Dinajpur, Haora and Purba Medinipur	Four	Black Quarter
4.	Jalpaiguri	One	Fasciolosis
5.	Birbhum, Haora, Hugli, Murshidabad, Nadia, Paschim Medinipur, South Twenty-Four Parganas and Uttar Dinajpur	Eight	Foot and Mouth Disease
5.	Bankura, Birbhum and Haora	Three	Haemorrhagic Septicaemia
6.	Bankura, Birbhum, Haora, Hugli and Nadia	Five	Peste des Petits Ruminants
7.	Birbhum, Dakshin Dinajpur and Haora	Three	Sheep & Goat pox
8.	Bankura, Bardhhaman, Birbhum, Haora, Hugli, Murshidabad, North Twenty Four Parganas and Paschim Medinipur	Eight	Theileriosis

iii) Diseases, Species affected, clinical signs and its preventive measures.

Sl No.	Disease	Species Affected	Clinical Signs	Preventive Measures
1	Anthrax (AX)	Most of the mammals and ruminants are highly susceptible. Pigs and Horses are moderately susceptible. Carnivores are relatively resistant.	Convulsion and sudden death with oozing of blood from natural orifices such as rectum and nose prior to death. Occasionally oedema develops in the throat and shoulder over a period of one week before death.	Ring vaccination and reporting of the disease is advised. Vaccination to be done in consultation with the veterinarians and as decided by state animal husbandry authorities. Strict biosecurity measures may be followed. Carcass may be disposed by deep burying covered with lime powder. Contaminated area may be disinfected with 4% formalin or 10% caustic soda. Grazing area may be restricted.
2	Babesiosis (BA)	Cattle. Cross breeds are more susceptible.	High temperature, jaundice like symptoms, yellowish mucosal membrane of eye, rectum and coffee colour urine.	Periodical application of acaricides in and around the animal shed and on the animals. For therapeutic application, Diaminazine or Imidocarb can be useful.
3.	Black Quarter (BQ)	Common disease of cattle and sheep, but occasionally goats and pigs also suffer from the disease.	High fever and lameness followed by swelling in the neck, shoulder, lumbar, gluteal and sacral regions. Skin over the affected area become dark and crepitate on palpation. Loss of feed intake, colic, lateral recumbency, dyspnoea and death.	Affected animals may be treated with suitable antibiotics. Vaccination to be done in consultation with the veterinarians and as decided by state animal husbandry authorities. Strict biosecurity measures may be followed. Grazing area may be restricted. Carcass may be disposed hygienically.

4.	Bluetongue (BT)	Sheep are more susceptible than goats.	Fever, swelling of face, neck, eyelids respiratory distress, nasal discharge, Salivation, necrotic ulcers on tongue, dental pad, gum, lips hyperaemia of muzzle and may bleed at muco-cutaneous junction. Affected tongue may become swollen, cyanotic and purple blue in colour – ′bluetongue′.	Vector control using insecticides and good water management. Vaccination of susceptible animals preferably in the month of May. Do not shear sheep during winter months. Restriction in animal movement, segregation of affected animals and symptomatic treatment. Strict biosecurity measures.
5.	Enterotoxaemia (ET)	Common disease of sheep and goats especially among the young animals.	Dullness, opisthosomas, convulsions, coma and sudden death. Affected adult sheep, which survive for several days May show diarrhoea and staggering.	Affected animals may be treated with suitable antibiotics. Vaccination to be done in consultation with the veterinarians and as decided by State Animal Husbandry Authorities. Strict biosecurity measures may be followed. Carcass may be disposed hygienically. Grazing area to be restricted, stall fed, vitamins and probiotics may be provided.
6.	Fasciolosis (FA)	Cattle, buffalo, sheep and goats.	Progressive anaemia, pale mucous membrane, sub-mandibular oedema (Bottle jaw), loss of appetite, weakness, isolated from flock while grazing, loss in production.	The animal should not be allowed to graze in water stagnant fields or submerged fodder should not be given directly to the animals. The submerged fodder can be processed through hay/silage preparation in order to destroy the metacercariae. The affected animals can be treated with Carbon tetrachloride/ Rafoxanide/Nitroxynil/ Niclofolan

			/Closantel/Oxyclozanide, under the strict supervision of veterinarian.
7.	Foot and Mouth Disease (FMD)	Cattle, buffalo, sheep, goats and pigs are often affected domesticated species, but the disease is more severe in cattle and pigs.	Fever, loss of feed intake, drop in milk production, drooling of saliva like ropey string, vesicles develop on the tongue, lips, gums, and palate and eventually rupture. Concurrent to oral lesions, vesicles also appear in inter digital skin and coronary band of the feet. The animal may open and close its mouth with a characteristic smacking sound. Sheep and goats may show lameness. In pigs, lesions may be seen on snout and also on the feet.	Regular vaccination and seromonitoring. Disinfection with sodium carbonate (4%) or 10% washing soda and strict biosecurity measures to be followed and animal movement may be controlled.
8.	Haemorrhagic septicaemia (HS)	Common disease for cattle and buffaloes, but can also occur among other species such as pigs, sheep, goats and many wild animals.	The disease starts with high fever, respiratory distress and haemorrhages maybe seen on the mucous membranes. There is lacrymation, nasal discharge, drop in milk production and anorexia. As the disease progress ear droops and the animals will be prostrated with cyanosis of mucous membranes. There may be oedema along the head, neck, thorax, vulva and anal areas. Sudden death	Affected animals may be treated with suitable antibiotics. Vaccination to be done in consultation with the veterinarians and as decided by state animal husbandry authorities. Strict biosecurity measures may be followed. Carcass may be disposed hygienically and stress factors may be reduced by following good animal hsbandry practices.

			occurs within few hours of clinical signs.	
9.	Peste desPetits Ruminants (PPR)	Goats and sheep are most affected domestic animals.	Fever, nasal and ocular discharge, respiratory distress, necrotic lesions in buccal mucosa, gum, dental pad, palate, tongue and diarrhoea. Animals may die because of dehydration and pneumonia.	Vaccination of susceptible animals of above 3 months old age. Restriction on animal movement, strict biosecurity measures and proper disposal of carcass.
10.	Sheep and Goat pox (SGP)	Sheep and Goats	Respiratory distress and pock lesions over the non-hairy parts of body, more common in teat, udder, scortum, head, neck, ear, perineum, inner aspect of thighs and under tail.	Vaccination of susceptible animals of above 3 months old age. Symptomatic treatment of affected animals. Restriction on animal movement, strict biosecurity measures and proper disposal of carcass.
11.	Swine Fever (SF)	Pigs	Fever, Conjunctivitis, purplish discolouration of snout, ears, abdomen, inner side of the legs and staggering gait.	Vaccination of susceptible animals. Restriction on animal movement, strict biosecurity measures and proper disposal of carcass.
12.	Theileriosis (TE)	Large Ruminants. Cross bred cattle are more vulnerable.	High temperature, yellowish eye, sometime eye maybe heavily swollen, icteric mucosal membrane of rectum, dark yellowish urine, sometime may reach to coffee colour. Antibiotic is of no use to check the fever.	Periodical application of acaricides in and around the animal shed and on the animals. Therapeutic treatment with Buparvaquone can be useful in both early and advanced stages of the infection.

| 13. | Trypanosomiasis (TR) | Domestic and wild carnivores and herbivores including cattle, buffalo, horse, donkey, camel, dog and cats. Buffaloes are known as carriers. | Fluctuating high fever which is not responded by antibiotics, swollen lymph gland, chronic emaciation and weakness, loss of appetite, gradual loss of production. | The affected animal should be treated with Diaminazine compounds or chloride and sulphate salts of Quinapyramine. Periodical spray of insecticide in and around animal shed to remove the flies. |

V. Forecasting of remote sensing and meteorological parameters till December 2021(*Ex. Tamil Nadu*)
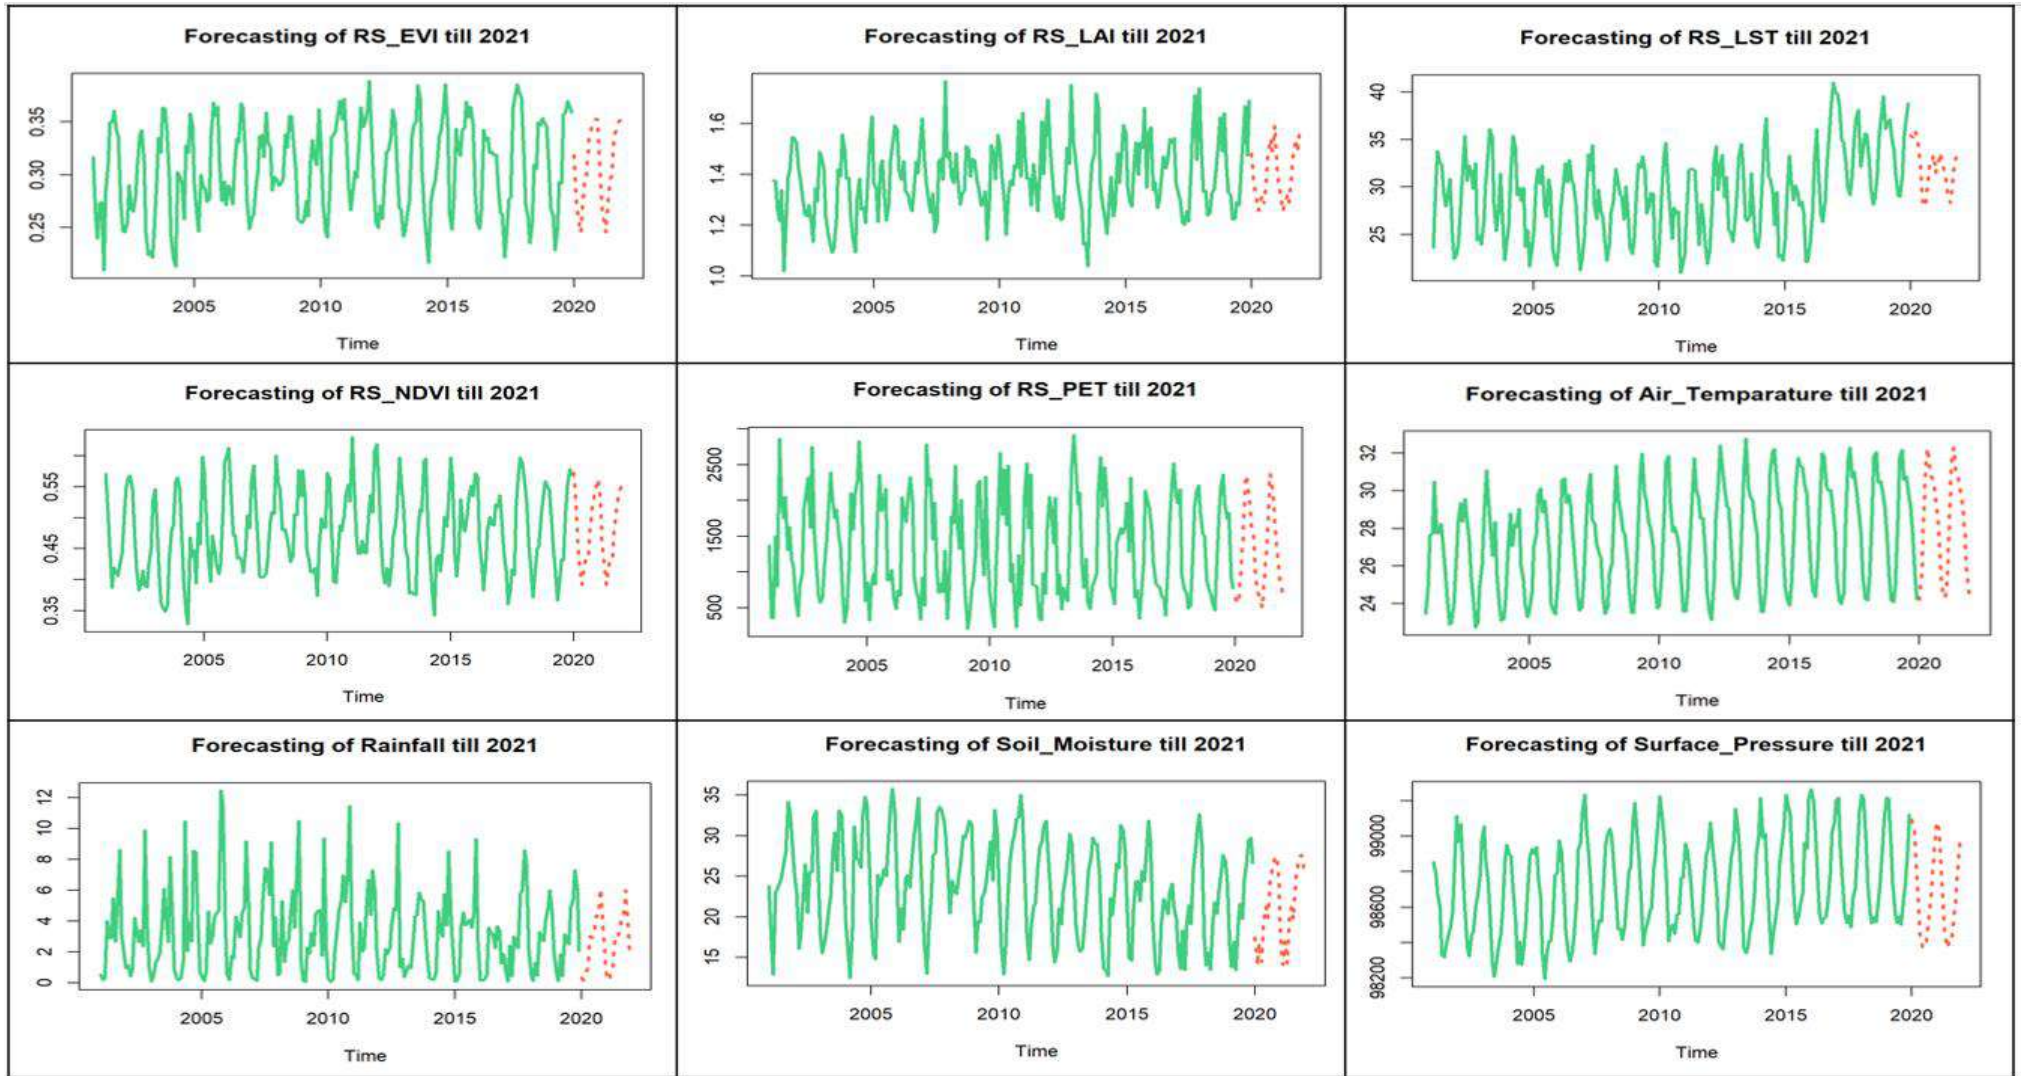

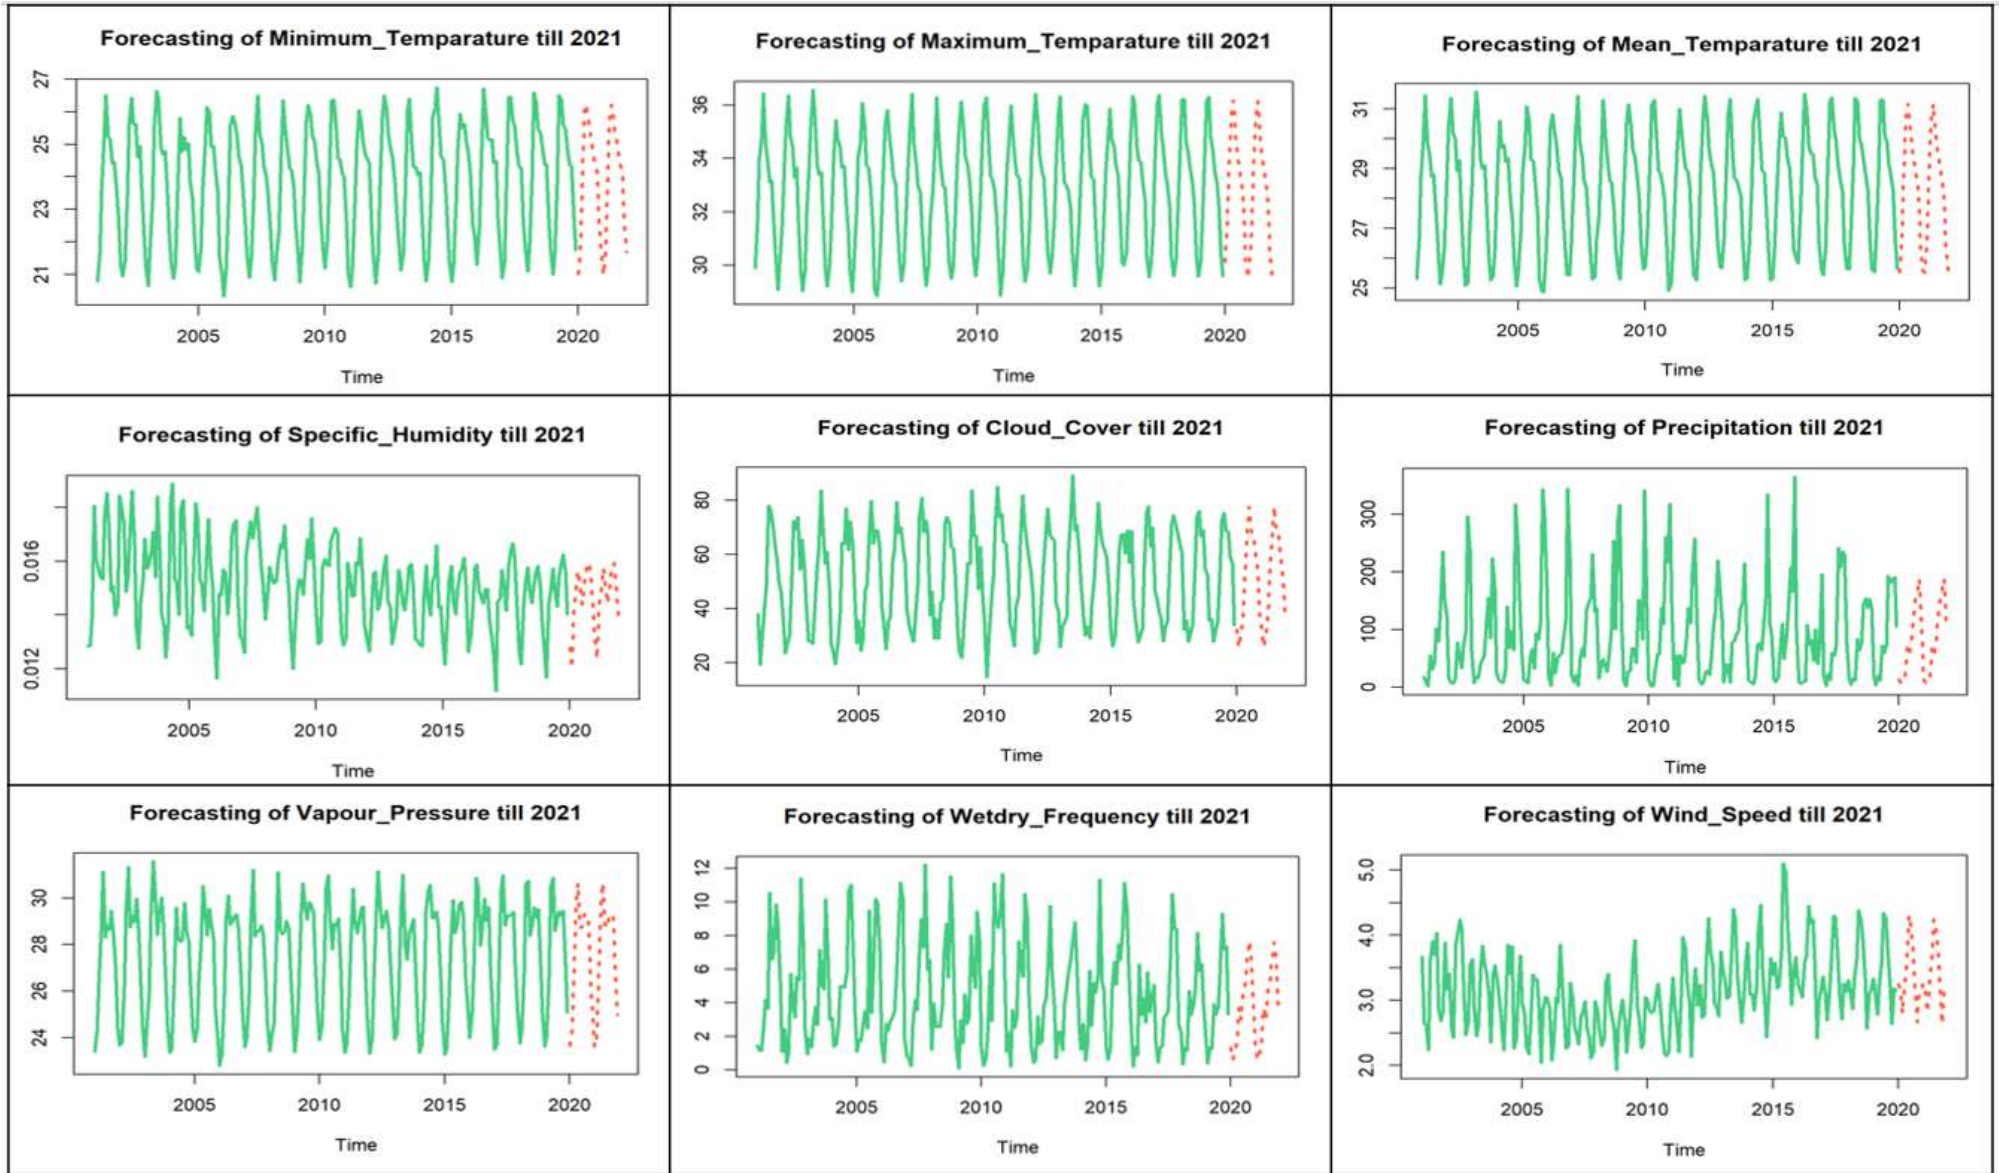

VI. SIGNIFICANT WEATHER PARAMETERS TABLE

Disease Names	Significant Parameters
Anthrax	Precipitable Water, Surface Pressure
Babesiosis	Air Temperature, Precipitation, Surface Pressure, Minimum Temperature, Vapour Pressure, Dew Point Temperature, Wind Speed, NDVI and LST Night
Black quarter	Precipitable Water, Precipitation, Surface Pressure, Sea Level Pressure and Vapour Pressure
Bluetongue	Air Temperature, Cloud, Precipitable Water, Precipitation, Surface Pressure, Uwind, Vwind, Vapour Pressure, Elevation, NDVI and PET
Classical Swine Fever	Cloud, Precipitation, relative humidity Minimum Temperature, Vapour Pressure and Rainfall
Enterotoxaemia	Surface Pressure, NDVI and PET
Fasciolosis	Air Temperature, Precipitation, relative humidity, Temperature, Maximum Temperature, Vapour Pressure, Vwind, Rainfall, Soil Moisture, NDVI and EVI
Foot and Mouth Disease	Precipitable Water, Uwind, Vwind, wet_dry frequency, LST Night and EVI
Haemorrhagic Septicaemia	Cloud, Precipitation and Vwind
Peste des Petits Ruminants	Cloud, Precipitable Water, Surface Pressure, Sea Level Pressure, Maximum Temperature, Vwind and NDVI
Sheep & Goat pox	Cloud, Surface Pressure, Maximum Temperature, Vwind, DTP, NDVI and PET
Theileriosis	Air Temperature, Precipitation, Vapour Pressure, NDVI and LST Night
Trypanosomiasis	Air Temperature, Precipitation, Surface Pressure, Vapour Pressure, NDVI and LST Night

Table 7.1: Significant weather parameters govern the Livestock disease incidence (forecast).

9. Post prediction Validation

Following reports of a good number of buffaloes dying in a recent outbreak of suspected Haemorrhagic septicaemia (HS), a team from Animal Husbandry and Veterinary Services (AH&VS) department visited the affected areas under Medziphema on April 12. (Haemorrhagic septicaemia is a contagious bacterial disease that affects cattle and water buffaloes with a high mortality rate in infected animals).

AH&VS, deputy director & principal investigator, AICRP-ADMAS, Dr S. Amenla Walling, in a press release reported that the team consisted of the department's director, Dr Temsumeren, along with additional director, Dr. Budhi Lama, and other officials from the department. The press release added that the area is prone to such kind of disease outbreaks and the department officials reminded villagers to cooperate with the department and vaccinate their animals against such outbreaks. The team told the villagers that even an outbreak can be contained more effectively if villagers report the matter on time to the nearest Veterinary Health Centre.

The villagers admitted in the meeting that they had not reported the recent outbreak to the department initially. The director appreciated the CVO Dimapur and his Rapid Response Team for their quick action after receiving information and for remaining stationed in the outbreak area to date. Free medicine was also distributed among the villagers. The department, through the press release also appealed to everyone to report such matters to the nearest Veterinary Health Centre (so that qualified staff may intervene quickly), instead of publicizing it in other ways. It stated that the department is prepared to extend services to any outbreak of diseases in animals to control such things.

The press release also pointed out that to control the recent outbreak, the department had to direct its officials to make their own transport arrangements to go to the affected areas because the State Election department did not consider an appeal to exempt the department's emergency duty vehicle from election duty.

Meanwhile, when contacted, Dr S. Amenla Walling told Nagaland Post that it is difficult to say if the disease has been fully contained since its free grazing season for the animals, but the department is doing its best under the circumstances.

Risk Prediction of Haemorrhagic septicaemia for the month of April 2019

Date: Tue 13 Apr 2021 6:32 AM IST
Source: The Sentinel [edited]
https://www.sentinelassam.com/north-east-india-news/arunachal-news/many-mithuns-infected-with-fmd-foot-and-mouth-disease-533689

A large number of mithuns [or gayal, a large domestic bovine] have been affected by FMD (foot-and-mouth disease) in various parts of Arunachal Pradesh, and a few have died, said official sources on Monday [13 Apr 2021].

Animal Husbandry & Veterinary Department Deputy director Dr Taba Heli, a top mithun expert in North Eastern region, reported that the disease has taken a severe form in the entire Siang belt, particularly in East Siang, West Siang, and Upper Siang districts.

Though the number of deaths is yet to be known, the disease has spread in scattered areas of Papum Pare district also. The Department has allocated district funds for procurement of medicines to take all possible steps to contain the disease, he said. Mithun deaths have been reported also from Itanagar and Jullang area.

Pointing out that mithuns are the pride of indigenous people in the state, Nyishi Elite Society president Bengia Tolum has urged the department to take all possible steps to save them.

JOINT DIRECTOR(LH)

9.1 Correlational Assessment

The number of outbreaks predicted and outbreaks actually reported were reported in table 9.1. It has been observed from the table that outbreaks predicted two months in advance and timely alerts were issued that helped the stakeholders to take appropriate preventive measures with in time and accordingly the reported outbreaks were very less. Though the use of artificial intelligence system is more beneficial for accurately predicting the livestock disease outbreaks, there are yet number of limitations, namely, there are expected to be under reporting and also non-reporting cases which created the uncertainties in the model predictions while translating model inputs in to model outputs. However, identifying these uncertainties in the prediction using statistical models and highlighting the importance of quality data may improve the model accuracy and confidence while building the model for livestock disease forecasting.

Table 9.1: Number of districts predicted for livestock diseases and reported

Livestock diseases	May-2020		June-2020	
	No of Districts predicted for the disease	No of districts reported the disease	No of Districts predicted for the disease	No of districts reported the disease
Anthrax	18	1	31	2
Babesiosis	57	22	40	21
Black quarter	77	2	71	1
Bluetongue	3	NA	NA	NA
Enterotoxaemia	24	1	25	1
Fasciolosis	49	15	55	22
Foot and mouth disease	64	6	46	5
Haemorrhagic septicaemia	75	6	57	5
Peste des petits ruminants	67	6	46	7
Sheep & Goat pox	12	3	43	5
Swine fever	38	7	28	4
Theileriosis	67	25	37	19
Trypanosomiasis	70	30	32	46

*which takes in to account of action taken for prediction and non-reporting of cases

10. Launch of Mobile Android app & link to download

Livestock forewarning application **(**LDF**)** can be downloaded following the link provided**:**http**://**www**.**nivedi**.**res**.**in/android_nadres/LDF**.**apkand google play store linkalso provided https**://**play**.**google**.**com/store/apps/details?id**=**info**.**androidhive**.**ldf

Further launch of LDF application was done, the news provided below**.**

Livestock Disease Forewarning (LDF Mobile App)
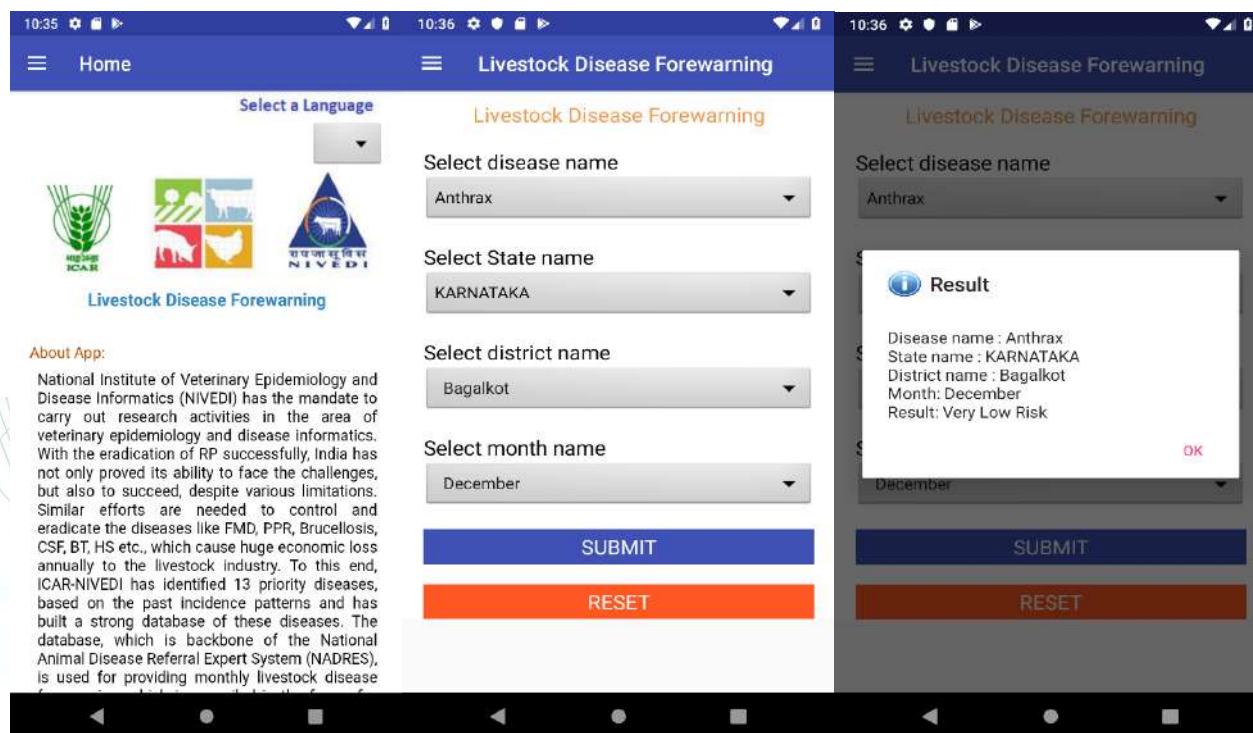

To extend the reach of the NADRES forewarning bulletin among the various stakeholders, a Mobile Application named Livestock Disease forewarning app ″LDF-Mobile *App* ″ was developed. The forewarning methodology adapted in the ″mobile app″ remains the same as monthly bulletin; it provides user interface to know the predicted forewarning results stored in NADRES MySQL database. A PHP web-based service is developed in Java to extract the results of forewarning two months in advance by keying state name, district name and disease name and display the same in the mobile app. In addition to forewarning, the LDF-Mobile App also provides the details of clinical samples to be collected in case of outbreaks of the listed diseases for laboratory confirmation and immediate preventive measures to be taken up in case of positive prediction/disease confirmation. The LDF mobile app is available at ICAR-NIVEDI website. It is available on Google play store.

12. INFECTION WITH SARS-COV-2 IN ANIMALS

<u>Aetiology</u>, <u>Epidemiology</u>, <u>Diagnosis</u>, <u>Prevention and Control</u>

Last updated on 3 July 2020

SARS-Coronavirus-2 (SARS-CoV-2) is the pathogenic agent that causes the disease COVID-19 and was first reported in December 2019. SARS-CoV-2 is thought to have emerged from an animal source and then spilled-over to the human population. Although genetically closely related viruses have been isolated from *Rhinolophus* bats, the exact source of SARS-CoV-2 and route of introduction into the human population has not been established.

The current pandemic of COVID-19 is being sustained through human-to-human transmission. Animal infections with SARS-CoV-2 have been reported by several countries. Several animal species have proven to be susceptible (Table 1) to infection with SARS-CoV-2 either naturally or by experimental infection. Important livestock species (pigs and poultry) have been demonstrated not to be susceptible to infection through experimental studies. Further studies are needed to understand if and how different animals could be affected by SARS-CoV-2.

It is important to monitor infections in animals to better understand their epidemiological significance for animal health, biodiversity, and human health. Evidence from risk assessments, epidemiological investigations, and experimental studies do not suggest that live animals or animal products play a role in SARS-CoV-2 infection ofhumans.

Infection with SARS-CoV-2 is not included in the OIE List of Diseases. However, consistent with the reporting obligations of Members outlined in Articles 1.1.4. and 1.1.6. of the OIE *Terrestrial Animal Health Code* relating toemerging diseases, the disease should be notified to the OIE through the OIE's World Animal Health Information System or via email.

AETIOLOGY
Classification of the causative agent
Corona viruses (CoVs) are enveloped, positive-sense, single-stranded RNA viruses. SARS-CoV-2 is a *beta coronavirus*, a genus that includes several coronaviruses (SARS-CoV, MERS-CoV, bat SARS-like CoV, andothers) isolated from humans, bats, camels, and other animals.
Susceptibility to physical and chemical action.
SARS-CoV-2 is inactivated by 62–71 % ethanol, 0.5% hydrogen peroxide or 0.1% sodium hypochlorite, within 1 minute, or 0.05–0.2 % benzalkonium chloride or 0.02 % chlorhexidine digluconate.

Survival:
In experimental conditions, SARS-CoV-2 remained viable in the environment after aerosolisation for at least 180 minutes. Experiences with other CoVs such as SARS-CoV, MERS-CoV, or endemic human corona viruses show that:
They can persist on surfaces such as metal, glass or plastic for upto 9 days, but can be efficiently inactivated by surface disinfection procedures, as listed above.
SARS-CoV was found to remain infectious for 14 days at 4 °C, but for only 2 days at 20 °C in sewage water.

Epidemiology

Hosts

Although current evidence suggests that SARS-CoV-2 emerged from an animal source, that source has yet to be identified. The pandemic is driven by person-to-person transmission through respiratory droplets from coughing, sneezing, and talking. Genetic sequence data reveal that SARS-CoV-2 is genetically closely related to other corona viruses circulating in *Rhinolophus* bat (horseshoe bat) populations. To date, there is not enough scientific evidence to identify the source of SARS-CoV-2 or to explain the original route of transmission to humans (which may involve an intermediatehost).

Several animal species have tested positive for SARS-CoV-2, mostly as a result of close contact with humans infected with SARS-CoV-2. In addition, preliminary findings from experimental infection studies suggest that poultry and pigs are not susceptible to SARS-CoV-2 infection. The list of animal species for which information on natural or experimental infection is available is presented in Table1.
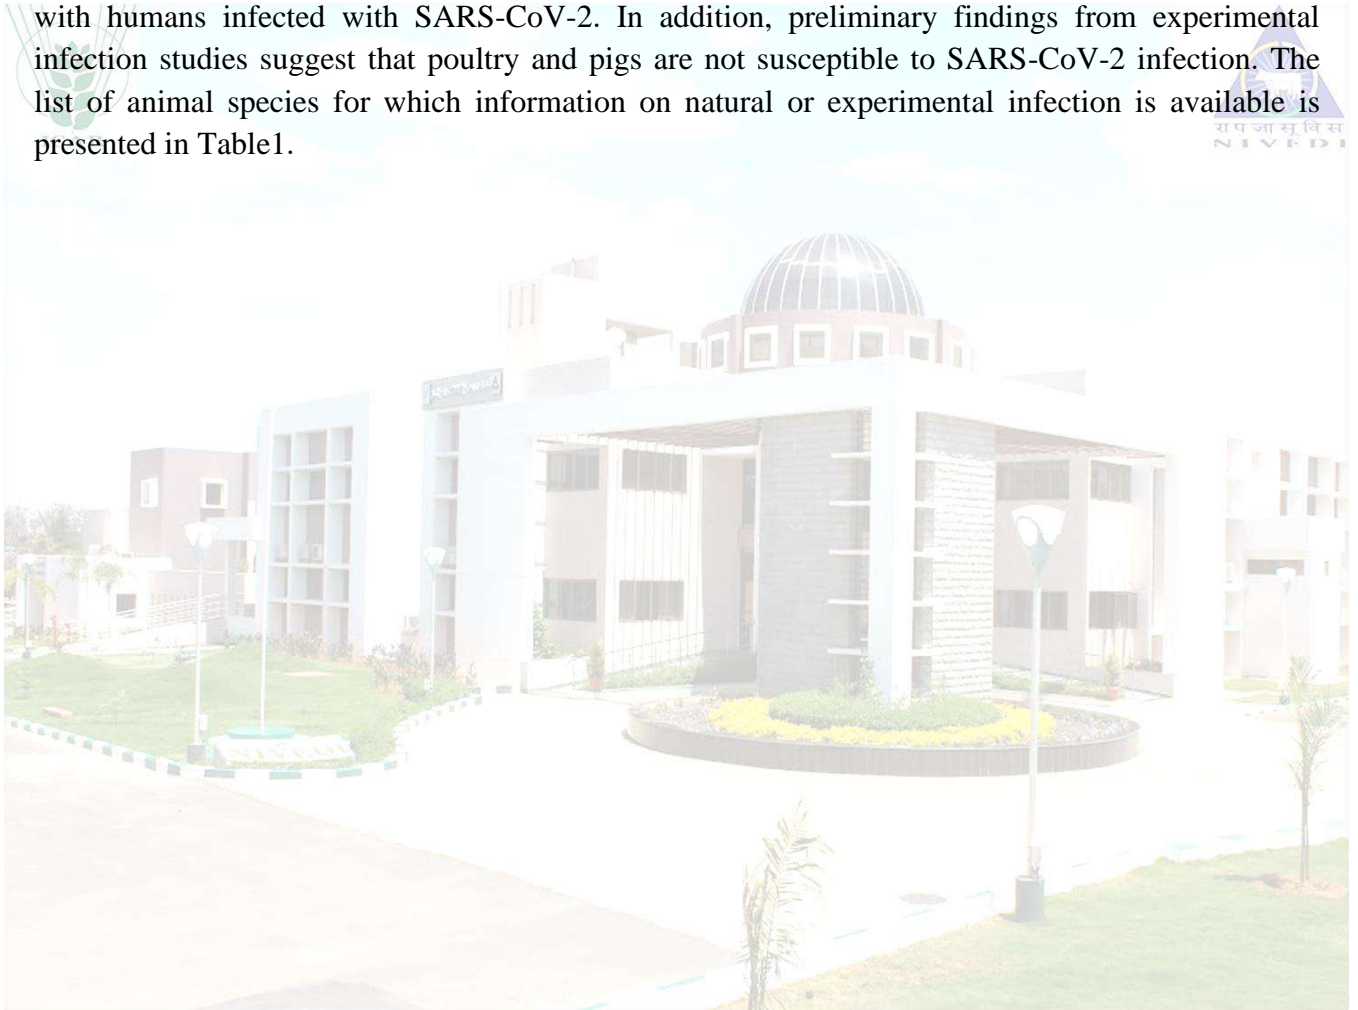

Table1.Summary of finding sin animals to date

Species	Type ofinfection	Susceptibility (none/low/high)	Clinicalsigns	Transmission
Pigs	Experimental	None	No	No
Poultry (chicken, ducks, and turkeys)	Experimental	None	No	No
Dogs	Natural and experimental	Low	No (possible in some cases)	No
Cats(domestic)	Natural and experimental	High	Yes (none to very mild in some cases)	Yes, between cats
Tigersandlions	Natural	High	Yes	Yes, between animals
Ferrets	Experimental	High	No (very mild in some cases)	Yes, between ferrets
Minks(Americanminks, *Neovisonvison*)	Natural	High	Yes	Yes, between minks and suggested from mink to humans
Egyptian fruit bats (*Rousettus aegyptiacus*)	Experimental	High	No	Yes, between Fruitbats
Golden Syrian hamsters	Experimental	High	Yes (none to very mild in some cases)	Yes, between hamsters
Macaques (*Macacafascicularis* and *Macacamulatta*)	Experimental	High	Yes	Yes

112

Transmission

Information on the routes of transmission of SARS-CoV-2 among animals is limited. However, as for other respiratory viruses, it appears to be transmitted to animals and between animals by direct contact (e.g droplets). SARS-CoV-2 has been found in secretions from the respiratory tract and in faeces.

Viraemia, incubation and infectious period

In laboratory settings, the incubation period in animals appears to be similar to the one seen in humans (i.e. between 2 and 14 days, with a mean duration of 5 days). However, more studies are required to solidly estimate the mean duration of incubation and the infectious periods.

Sources of virus

The main source of the virus is respiratory droplets and respiratory secretions, although it is possible to isolate SARS-CoV-2 from faeces of infected animals.

Pathogenesis

In laboratory settings, infected animals showed presence of the virus in the respiratory tract and, in some cases, lesions in the trachea and lungs, associatedwith dyspnoea and cough.

Occurrence and impact

There have been sporadic reports of companion animals and captive wild animals infected with SARS-CoV-2. With regard to production animals, to date, SARS-CoV-2 has only affected mink farms in the Netherlands, with high morbidity and low mortality.

Diagnosis

Knowledge about the susceptibility of different animal species to SARS-CoV-2 infection and clinical signs is, to date, limited (see Table 1).

Clinical diagnosis

Knowledge about clinical disease manifestations in animals is limited. Current evidence suggests clinical signs may include, but are not limited to, coughing, sneezing, respiratory distress, nasal discharge, ocular discharge, vomiting or diarrhoea, fever and lethargy. Asinhumans, asymptomatic infections occur.

Lesions

More studies are needed to systematically categorise the lesions resulting from infection with SARS-CoV-2 in animals.

In transgenic mice expressing the human version of the SARS-CoV-2 ACE2 receptor, the typical histopathology outcome was interstitial pneumonia with significant inflammatory cell infiltration around the bronchioles and blood vessels, and viral antigens were detected in bronchial epithelial cells and alveolar epithelial cells. These pathological findings were not seen in wild type mice infected with SARS-CoV-2. In golden Syrian hamsters, histopathological changes were reported in the respiratory tract and spleen. Rhesus macaques infected with SARS-CoV-2 presented lesions similar to those seen in humans. Juvenile cats infected with SARS-CoV-2 presented massive lesions

in the nasal and tracheal mucosa epithelia, and lungs. SARS-CoV-2 can replicate in the upper respiratory tract of ferrets without causing severe disease and only resulting in pathological findings such as severe lymphoplasmacytic perivasculitis and vasculitis, increased numbers of type II pneumocytes, macrophages, and neutrophils in the alveolar septa and alveolar lumen, and mild peribronchitis in the lungs.

Differential diagnosis

All other causes for respiratory or digestive illness should be excluded before a tentative diagnosis for infection with SARS-CoV-2 is made. Existence of an epidemiological link with a confirmed infection, in humans or other animals should be considered when narrowing down the listof differential diagnoses.

Laboratory confirmatory tests are necessary for a final diagnosis.

Laboratory diagnosis

Samples

Depending on the type of test, samples may include single or combinations of oropharyngeal, nasal, and rectal swabs, and blood. Faecal samples may be used in situations where direct sampling is not possible due to risks to the animal or testing staff. Tests should be validated for the purpose, species and matrix tobe analysed.

Procedures

Agent identification

- Reverse-transcription polymerase chain reaction (RT-PCR);
- Reverse transcription loop-mediated isothermal amplification (RT-LAMP);
- Other molecular tests developed for use in humans;
- Virus isolation;
- Virus genome sequencing.

Detection of immune response:

- ELISA antibody test;
- Virus neutralisation test (VNT);
- Several other tests for antibody detection.

Prevention and control

Biosecurity and hygiene measures are key to preventing transmission of SARS-CoV-2.
People who are suspected or confirmed to be infected with SARS-CoV-2 should restrict contact with mammalian animals, including pets, just like they would with people during their illness.

Animals suspected or confirmed to be infected with SARS-CoV-2 should remain separated from other animals and humans.

ICAR - National Institute of Veterinary Epidemiology and Disease Informatics

Customer/Client Feedback Form
Feedback for the Livestock Diseases forewarning bulletin of August 2021, Volume 9 and Issue 8

(Please return this duly fill in after receiving the outbreak report of October-2021)

1. **Details of the number of districts with diseases reported vs. forecast in your state.**

Sl. No	Diseases Name	No of districts outbreak occurred but not alerted**	Measure taken in case of disease forecasted: Yes or No**	Any other
1.	Anthrax			
2.	Babesiosis			
3.	Black Quarter			
4.	Bluetongue			
5.	Enterotoxaemia			
6.	Fasciolosis			
7.	Foot and mouth disease			
8.	Haemorrhagic septicaemia			
9.	Peste des Petits Ruminants			
10.	Sheep & Goat pox			
11.	Swine fever			
12.	Theileriosis			
13.	Trypanosomiasis			

**Details may be written here.

2. **What are the preventive measures taken in case of outbreak predicted?**

3. **How would you rate your satisfaction with the following aspects of the services you have received or accessed?**

Description	Very satisfied	Satisfied	Unsatisfied	Not sure
Quality of services provided				
Timeliness of alerts received				
Benefits from forecasting of livestock diseases				
Your awareness of this service				

4. **Suggestions for further improvement of report.**
